About The Steel Network, Inc.:

The Steel Network, Inc. (TSN) is a manufacturer of light gauge (cold-formed) steel studs and connectors based in the United States. TSN provides solutions for all standard light steel framing applications, including load-bearing mid-rise construction systems, curtain wall systems, rigid connectors, vertical deflection connectors, lateral drift connectors and anchorage connectors. Substantial effort has been made by the industry to standardize construction practices to ensure the positive connections of light steel framing components. Toward this end, all TSN products have undergone extensive field and laboratory testing to achieve complete solutions for both designers and installers. TSN's SigmaStud® load bearing mid-rise construction system is widely used in commercial and government construction, such as hotels, dormitories and military barracks. TSN connector products are used in facade and interior light steel framing of any type of building.

In addition to its light gauge steel products, the Steel Network's subsidiary, Applied Science International (ASI), specializes in the development of engineering analysis and design software. Two primary ASI software products are SteelSmart® System (SSS) for light steel framing design, and Extreme Loading® for Structures (ELS) for analysis of structures under extreme loads (earthquakes, high wind, impact, blast, and progressive collapse). In addition to software development, ASI also provides consultation services in the fields of demolition analysis and planning, forensic engineering, blast analysis and design, progressive collapse design, and structural vulnerability assessment.

TSN's competitive advantage lies in the cost savings, rapid construction and green design/construction options provided by its core product lines, SigmaStud® Load-bearing Building System, BridgeClip®, VertiClip®, DriftClip®, PrimeWall® and Engineering Software.

Load Bearing Wall Members

SigmaStud® Introduction

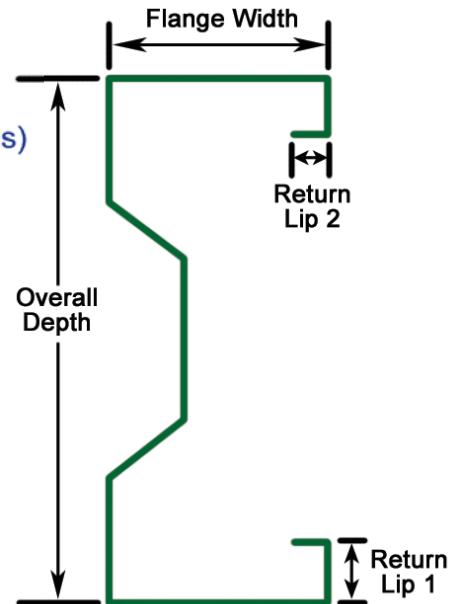

Background

SigmaStud® is a breakthrough in the load-bearing steel stud industry, producing significant increases in load capacity when compared with conventional "C" Shaped studs. SigmaStud's unique configuration provides installation and design advantages which create efficiencies no other light steel framing (LSF) load bearing wall stud can provide. Each bend made to a flat LSF element increases load capacity over a standard stud section with the same material thickness. The return lips present in SigmaStud also increase capacity, delivering the most efficient LSF load-bearing stud member available. SigmaStud redefines previous limitations considered for utilization of steel studs in building construction, producing more cost-effect options for designing load bearing walls for clients.

Material Properties:

ASTM A1003/A1003M or ASTM A653/A653M, Grade 50(340), 50ksi (340MPa) minimum yield strength, 65ksi (450 MPa) minimum tensile strength, G-60 (Z180) hot-dipped galvanized coating; or equivalent.

Benefits That Add Value:

Weight Advantages

- Lighter weight results in easier handling & shipping efficiencies
- Reduction of wall mass & labor costs
- 80% lighter than concrete/masonry block, optimizing foundation thickness

Fastener Efficiencies

- Screw size decreases with thinner material thickness of member material, facilitating faster connections
- Larger flange width increases area for fasteners

Performance Improvements

- Increased load capacity over similar standard "C-shaped" stud (14ga "C-shaped" to 18ga "SG" common)
- May eliminate double studs and their attachments to each other
- Compatible with all common types of floor systems and designs
- Accelerate construction schedules

Engineering Advantages

- Axial load capacity tables compatible with recent code changes

Design Comparison of SigmaStud® and Standard "C-Shape" Studs

Design Assumptions: Wall height: 9 feet; Bridging at 48" o.c. (vertically); Stud Spacing at 16" o.c.; Single or Back-to-Back Members Only; L/180 Deflection; $F_y = 50$ ksi for Both C-Shape and SigmaStud; 5 psf Lateral Load; No Load Reductions Taken.

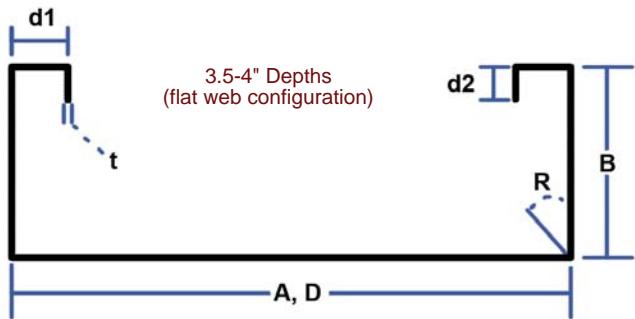

Axial Load	"C" Shape, 1 5/8" Flange	"C" Shape, 2" Flange	SigmaStud® Section	Comparison Conclusion
4k	600S162-54	600S200-43	600SG162-33	
8k	600S162-97	600S200-68	600SG200-43	
12k	(2) 600S162-54	600S200-97	600SG250-54	
16k	(2) 600S162-68	(2) 600S200-54	600SG250-68	
20k	(2) 600S162-97	(2) 600S200-68	600SG250-97	
24k	(2) 600S162-97	(2) 600S200-97	600SG250-97 or (2) 600SG250-54	
30k	(3) 600S162-97	(2) 600S200-97	600SG300-118 or (2) 600SG250-68	The data presents tangible examples of the exceptional value SigmaStud provides for designers, installers, and owners. In each case, SigmaStud represents a thinner and lighter option, resulting in significant material and labor efficiencies. As the axial load increases, the differences between a single member and 2 or even 3 "ganged" members become even more evident. The ganged members should be connected, either back-to-back or lip-to-lip. Back-to-back ganged studs are connected with either an engineered weld, flat strap and screws along the flanges, or screws through each web placed vertically at 24"o.c. (typical). Use of a single SigmaStud section eliminates the additional engineering as well as the installation of these elements. Contact TSN's technical support team for design recommendations.

Load Bearing Wall Members

SigmaStud® Product Profile

Important Notes

- Section properties and capacities are calculated in accordance with AISI S100-07 with 2010 supplement.
- Tabulated gross properties are based on the full-unreduced cross section of the studs, away from punchouts.
- Effective section properties incorporate the strength increase from the cold-work of forming as applicable per AISI S100-07 Sec. A7.2.
- Net effective section properties are calculated at a cross section through the punchout.
- Allowable moment is the lesser of M_{al} and M_{ad} . Stud distortional buckling is based on an assumed $k_0 = 0$.
- For deflection calculations, use the effective moment of inertia.
- The effective moment of inertia for deflection is calculated at a stress which results in a section modulus such that the stress times the section modulus at that stress is equal to the allowable moment. AISI S100-07 Procedure I for serviceability determination has been used.

SigmaStud® Section Properties

Important Notes

1. Section properties and capacities are calculated in accordance with AISI S100-07 with 2010 supplement.
2. Tabulated gross properties are based on the full-unreduced cross section of the studs, away from punchouts.
3. Effective section properties incorporate the strength increase from the cold-work of forming as applicable per AISI S100-07 Sec. A7.2.
4. Net effective section properties are calculated at a cross section through the punchout.
5. Allowable moment is the lesser of M_{al} and M_{ad} . Stud distortional buckling is based on an assumed $k_\phi = 0$.
6. For deflection calculations, use the effective moment of inertia.
7. The effective moment of inertia for deflection is calculated at a stress which results in a section modulus such that the stress times the section modulus at that stress is equal to the allowable moment. AISI S100-07 Procedure I for serviceability determination has been used.

Load Bearing Wall Members

Table Notes & Examples

Table Background And Example

1. Basis For Tables:

The SigmaStud Combined Axial and Lateral Load tables in this catalog cover the following basic load combinations for the Allowable Stress Design (ASD) Method (IBC 2009/2012 and ASCE 7-05/10). Listed wind pressures represent calculated design wind pressure (1.0W based on 2009 or 0.6W based on 2012 IBC).

- IBC 2009 / ASCE 7-05
 - i. D + L (Strength Determination)
 - ii. D + 0.75L + 0.75W_{MWFRS}* (Strength Determination)
 - iii. 0.70W_{C&C}** (Deflection Determination)
- IBC 2012 / ASCE 7-10
 - i. D + L (Strength Determination)
 - ii. D + 0.75L + 0.75(0.6W_{MWFRS}*) (Strength Determination)
 - iii. D + 0.70(0.6W_{C&C}**) (Deflection Determination)

* MWFRS: Main Wind Force Resisting System

** C&C: Component and Cladding

- For deflection determination IBC 2009 and IBC 2012 Sec. 1604.3 and AISI S211-07 Wall Stud Design Standard Sec. A3.1 allows for a reduction factor of 0.7 on the component and cladding wind load (0.7WC&C).

2. Design Example:

Given:

Service (Un-factored) Loads:

Axial Dead Load	= 1.6 kips
Axial Live Load	= 3.2 kips
Wind Pressure (W _{MWFRS})(ASCE 7-05) OR (0.6W _{MWFRS})(ASCE 7-10)	= 28 psf
Wind Pressure (W _{C&C})(ASCE 7-05) OR (0.6W _{C&C})(ASCE 7-10)	= 40 psf
Wall Width	= 6 in.
Stud Height	= 12 ft.
Stud Spacing	= 16 in. o.c.
Specified Deflection Limit	= L/360
Bridging (Lateral Bracing) at maximum vertical spacing of 48" o.c.	

Calculations:

- a) Use the D + L load combination to get the first estimate of the stud.
Combination total axial load = 1.6 kips + 3.2 kips
= 4.8 kips
From the "No Lateral Load" table with a 12 ft wall height, choose 600SG200-43 (50 ksi) with an axial resistance of 9.35 kips > 4.8 kips. OK
- b) Check the D + 0.75L + 0.75W_{MWFRS} (IBC 2009 / ASCE 7-05) OR D + 0.75L + 0.75(0.6W_{MWFRS}) (IBC 2012 / ASCE 7-10) load combination for strength.
Combination total axial load = 1.6 kips + 0.75(3.2 kips)
= 4.0 kips
0.75W_{MWFRS} OR 0.75(0.6W_{MWFRS}) = 0.75 x 28 psf = 21 psf (approximately 20 psf)
Go to the "Lateral Load = 20 psf" table with a 12 ft. wall height and 16 in. stud spacing. The axial resistance for 600SG200-43 (50 ksi) is 6.20 kips > 4.0 kips. OK
- c) Check the 0.70W_{C&C} (IBC 2009 / ASCE 7-05) OR 0.70(0.6W_{C&C}) (IBC 2012 / ASCE 7-10) load combination for deflection. The specified limit is L/360.
Go to the "Lateral Load = 40 psf" table with a 12 ft. wall height and 16 in. stud spacing. The deflection parameter for 600SG200-43 (50 ksi) is blank, which indicates that deflection is less than L/720 < L/360. OK

Conclusion:

Use 600SG200-43 (50 ksi) (with design thickness = 0.0451" and F_y = 50 ksi) spaced at 16 in. o.c. with 2 lines of bridging arranged so that the maximum spacing does not exceed 48 in. (4 ft.)

3. Extra Design Considerations:

- a) Check lateral end reaction of the stud for web crippling if applicable.
- b) If the specified axial dead load acting on the stud is significantly larger than the specified axial live load, the following basic load combination needs to be checked as well:
 - IBC 2009 / ASCE 7-05
 - i. D + W_{C&C} (Strength Determination)
 - IBC 2012 / ASCE 7-10
 - i. D + (0.6W_{C&C}) (Strength Determination)

Load Bearing Wall Members

Combined Axial & Lateral Load Tables

Important Notes

- Allowable loads are based on weak axis and torsional bracing at 48" o.c. maximum for axial load calculation and continuous support of each flange for flexural calculation.
- Sections are punched with a standard punch-out 1.5" wide located along the centerline of the web 24" o.c.
- Allowable loads are based on checks for punched section under axial load, flexural, and shear conditions.
- Weak axis and torsional bracing should have sufficient stiffness and strength to resist the axial load.
- The allowable axial strength for distortional buckling is based on an assumed $k_0 = 0$.
- Strength increase due to cold forming is incorporated in calculating allowable loads as per AISI Specification Sec. A7.2.
- Contact The Steel Network if web crippling capacity values of SigmaStud® are required to check lateral end reactions.
- Loads in tables are in kips/stud.

No Lateral Load (For Load Combination 1.0 [D+L])

Load Bearing Wall Members

Combined Axial & Lateral Load Tables

Important Notes:

- Allowable loads are based on weak axis and torsional bracing at 48" o.c. maximum for axial load calculation and continuous support of each flange for flexural calculation.
- Sections are punched with a standard punch-out 1.5" wide located along the centerline of the web 24" o.c.
- Allowable loads are based on checks for punched section under axial load, flexural, and shear conditions.
- Weak axis and torsional bracing should have sufficient stiffness and strength to resist the axial load.
- The allowable axial strength for distortional buckling is based on an assumed $k_y = 0$.
- Lateral loads have not been modified for strength checks: full loads are applied.
- Listed wind pressures represent calculated design wind pressure (1.0W based on 2009 or 0.6W based on 2012 IBC).
- 15 psf and higher wind pressures have been multiplied by 0.7 for deflection determination, in accordance with footnote "f" of IBC table 1604.3. The 5 psf pressure has not been reduced for deflection checks.
- 5 PSF is classified as live transverse loads, not wind loads, per 2009 IBC Section 1607.13 and 2012 IBC Section 1607.14.
- Strength increase due to cold forming is incorporated in calculating allowable loads as per AISI Specification Sec. A7.2.
- Moment of inertia for deflection is optimized based on the maximum moment at service loads for the listed spans; therefore; span values may be greater than spans based on an effective moment of inertia listed in section property tables.
- Contact The Steel Network if web crippling capacity values of SigmaStud® are required to check lateral end reactions.
- Loads in tables are in kips/stud (1 kip = 1,000 pounds).

Load Bearing Wall Members

SigmaStud®: STC Ratings and UL Assemblies

Fire Ratings

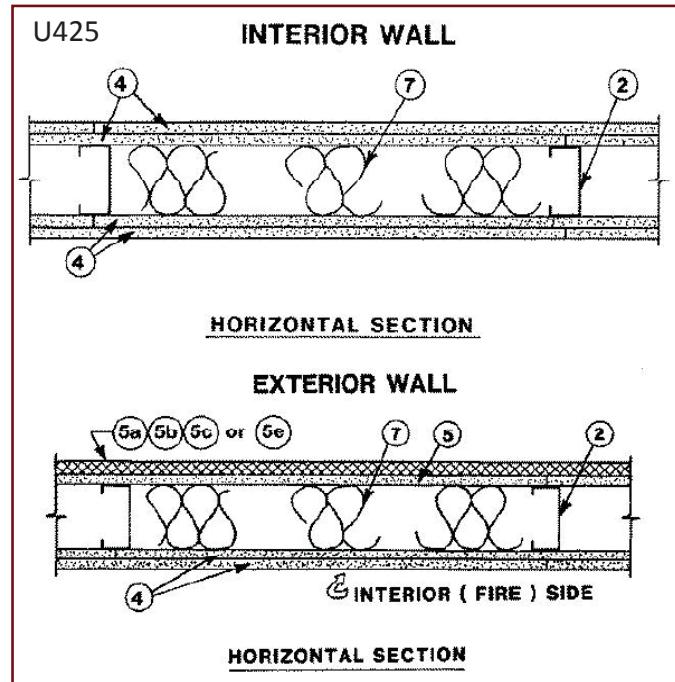

SigmaStud® projects have revealed that a proprietary shaped load-bearing member does not affect the fire rating of a wall versus using standard (S) section studs. The general requirements of steel studs in a fire-rated load bearing wall includes that the studs shall be designed in accordance with the current edition of the AISI Specification for the Design of Cold-Formed Steel Structural Members. Studs shall be corrosion-protected, have a minimum stud size of 3.5 inches, minimum thickness of 33 mil (20 ga), and maximum spacing between studs shall not exceed 16 or 24 inches.

UL's Fire Resistance Ratings vary from 45 minutes to 4 hours. The full report for each Fire Resistance Rating can be found on UL's website (www.ul.com). To obtain the report, click on Online Certifications Directory under Tools at the bottom of the UL homepage. Search by UL File Number. Click on the file link to view report. For technical assistance, please contact UL directly at 1-877-ULHELPS.

A complete listing of all UL Fire Resistance Ratings for use with cold-formed steel studs can be obtained through UL; we have simply attempted to outline the more commonly-used ratings below.

Load Bearing Fire Rated Details

U404 - LOADBEARING (1 or 2 hr) - Interior Wall
U407 - LOADBEARING (1 hr) - Interior Wall
U418 - LOADBEARING (45 min - 2 hr) - Exterior Wall
U423 - LOADBEARING (45min - 2 hr) - Interior Wall
U424 - LOADBEARING (45 min - 2 hr) - Exterior Wall
U425 - LOADBEARING (45 min - 2 hr) - Exterior Wall with detail for Interior
U426 - LOADBEARING (3 hr) - Interior Wall
U432 - LOADBEARING (1 hr) - Interior Wall
U434 - LOADBEARING (1 hr) - Interior Wall
U440 - LOADBEARING (1 hr) - Interior Wall
U460 - LOADBEARING (1 hr) - Interior Wall
U462 - LOADBEARING (3 hr) - Interior Wall
U473 - LOADBEARING (1 hr) - Interior Wall
U477 - LOADBEARING (2 hr) - Interior Wall
U485 - LOADBEARING (1 hr) - Interior Wall
U487 - LOADBEARING (1 hr) - Interior Wall
U490 - LOADBEARING (3 or 4 hr) - Interior Wall
U530 - LOADBEARING (4 hr) - Interior Wall
V415 - LOADBEARING (2 hr) - Interior Wall
V420 - LOADBEARING (2 hr) - Interior Wall
V432 - LOADBEARING (1 hr) - Exterior Wall
V434 - LOADBEARING (1 hr) - Interior Wall
V446 - LOADBEARING (1 or 2 hr) - Interior

Sound Transmission Ratings

The Gypsum Association maintains details to obtain fire resistance and Sound Transmission Class (STC) Ratings. These details are designated by a Wall and Partition (WP) System. Each detail is outlined in the Gypsum Association Fire Resistance Design Manual. The details mentioned below were obtained from the 20th Edition - June 2012 publication. For additional information on Gypsum Association or to acquire a copy of the Manual, visit www.gypsum.org.

A complete listing of all WP details is not shown; TSN has attempted to list only the generic details unless no generic details were available for a specific application.

Load Bearing WP Details

WP 1021 - 1 hr (50-54 STC)
WP 1024 - 1 hr (50-54 STC)

Load Bearing Wall Members

SigmaStud® Web Reinforcement

SigmaStud® Punchouts

Each SigmaStud contains punchouts which are 1.5" wide and 4" tall, spaced every 24" o.c. vertically. The first punchout begins 12" o.c. from the end of the stud.

Custom punchout spacing is available upon request. Some restrictions apply.

Reinforcing Non-Standard Holes in SigmaStud®

Any larger holes cut into SigmaStud® require a review by the engineer, as load capacity is based on the existence of standard punchout sizes. With the realization that additional holes do manage to appear in studs, TSN provides the SigmaStud (SG) Web RFT to provide reinforcement of a hole or holes added to the stud web during construction, when holes larger than the standard knockout are introduced into the web of the member. Use of the SG Web RFT ensures that the load capacity of the stud is not compromised when these types of oversized holes are present.

- No loss of stud strength when using the SigmaStud Web RFT with up to a 3" hole.
- Each SigmaStud Web RFT contains 12 pre-drilled guide holes in the center section and 12 in the outside flanges, 6 per side, to ensure proper placement of the (24) #12 self-drilling self-tapping screws required.
- All modifications to SigmaStud must be reviewed by a structural engineer).
- Contact TSN's Project Management Team at (888) 474-4876 for more recommendations.
- Non standard holes may not exceed half of stud depth.

Nomenclature

SigmaStud® Web RFT is available in 54 or 97 mil thicknesses, and is designed for use with 550 & greater sized SigmaStud.

Designate: SG Web RFT-54 or SG Web RFT-97

* Use SG Web RFT-54 for SigmaStud 54mil and lower. Use SG Web RFT-97 for SigmaStud 97mil and higher.

Material Properties:

ASTM A1003/A1003M or ASTM A653/A653M, G-60 (Z180) minimum hot-dipped galvanized coating; or equivalent. Grade 50 (340), 50ksi (340 MPa) minimum yield strength, 65ksi (450 MPa) minimum tensile strength or 33ksi (230MPa) minimum yield strength, 45ksi (310 MPa) minimum tensile strength.

SigmaStud®: Important Design Considerations

Wall In-Line Framing

Building loads must transfer from the vertical element above (e.g. SigmaStud® wall) to the horizontal element (e.g. Floor System), and to the vertical bearing element below (e.g. SigmaStud wall). To achieve this load transfer, the wall framing must align vertically.

Example of framing aligned vertically. The red lines trace the axial load vertically from the roof to the foundation.

Trusses bearing on the studs, which are aligned vertically to the foundation (red lines). When truss spacing differs from stud spacing, a distribution lintel is required to transfer the load from the truss to the studs below (blue line).

SigmaTrak® Runner Track Improvement

600SGT150-43, 50ksi

Overall Depth
(Inside to Inside)

SGT
SigmaTrak® Section

Leg Length

Material Thickness

Product Description

SigmaTrak® is the ideal runner track for load bearing and curtain wall metal stud wall assemblies. Manufactured from mill-certified steel, SigmaTrak's unique shape is designed to allow a stud to seat fully within the track, providing full bearing at the top and bottom structural tracks. Load bearing studs must be fully seated within the top and bottom tracks according to design standards.

SigmaTrak eliminates field issues typically seen with (T) section tracks where the studs bear directly on the corner radius of the track, creating gaps between the stud and track.

Benefits That Add Value:

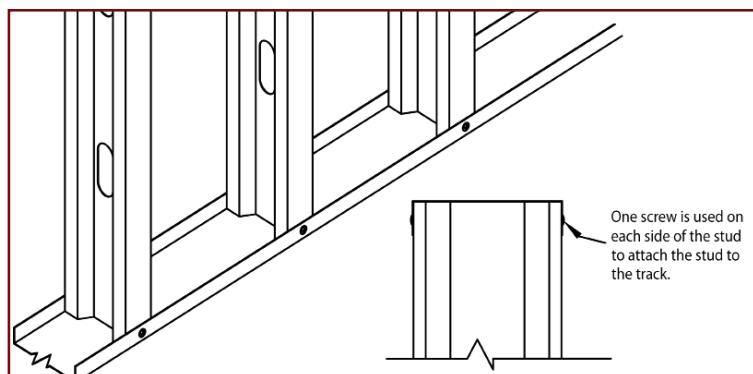

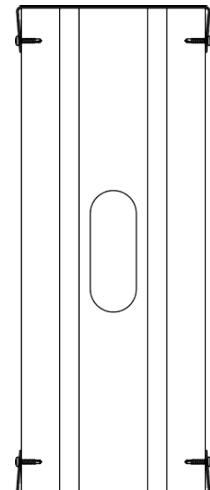

- Track web is oversized to allow the stud to seat fully in the track
- Eliminates the gap between the stud and the track as a result of bearing on corner radii
- Faster assembly than with standard track (no forcing/squeezing stud into bearing on track radii)
- Manufactured from traceable mill-certified steel
- Manufacturing tolerances based on ASTM C955-11c

Track Recommendations

- The top and bottom track should match the stud thickness
- Minimum track thickness = 54mils
- When welding is required to the top track, it is recommended to use a 14ga (68mils) thickness. Welding may be used as a means of attaching light gauge components, and should be performed by an AWS certified welder.

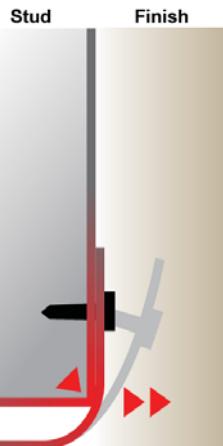

Material Properties:

ASTM A1003/A1003M or ASTM A653/A653M, G-60 (Z180) minimum hot-dipped galvanized coating; or equivalent. Grade 50 (340), 50ksi (340 MPa) minimum yield strength, 65ksi (450 MPa) minimum tensile strength or 33ksi (230MPa) minimum yield strength, 45ksi (310 MPa) minimum tensile strength.

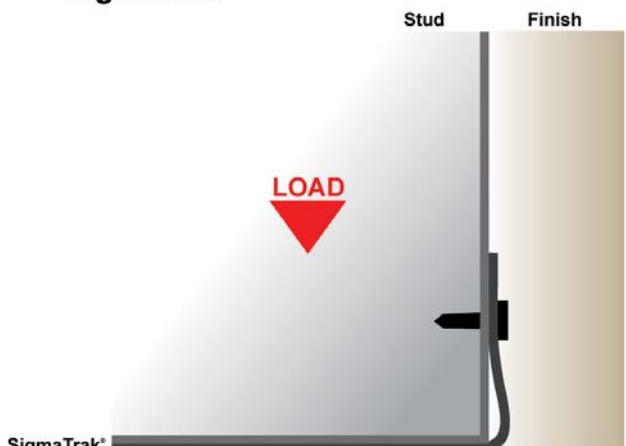

Load bearing walls are designed to fully seat within the top and bottom tracks. Design standards recommend a maximum gap of $\frac{1}{8}$ " in order to obtain an effective bearing condition.

Standard Track

SigmaTrak®

Standard track (T) sections (above left) can contain an inside corner radius that prevents "full" bearing within the track. SigmaTrak (above right) allows full bearing of the stud within the track

Load Bearing Wall Members

SigmaTrak® Section Properties

Important Notes:

1. Web depth for track sections is equal to the nominal height plus 2 times the design thickness plus 2 times the bend radius.
2. Effective properties incorporate the strength increase from the cold-work of forming as applicable per AISI A7.2.
3. For deflection calculations, use the effective moment of inertia.
4. The effective moment of inertia for deflection is calculated at a stress which results in a section modulus such that the stress times the section modulus at that stress is equal to the allowable moment. AISI S100-07 Procedure I for serviceability determination has been used.

¹ I_{ye} and M_{ya} are based on the web element in tension.

² I_{ye} and M_{ya} are based on the web element in compression.

³ Web height to thickness ratio exceeds 200. Web stiffeners are required at all support points and concentrated loads.

Load Bearing Wall Members

SigmaTrak® Section Properties

Redefining Value Engineering

The Steel Network identifies value engineering opportunities when framing with Cold-Formed Steel (CFS) systems. CFS is proven to reduce overall costs and accelerate construction schedules while meeting building code requirements.

- Lower overall project costs
- Material cost savings in the wall system
- Reduced foundation requirements and cost
- Accelerated construction schedules
- Fewer subcontractors on the job
- Satisfied Developers, Contractors, Structural Engineers and Architects

What does TSN's Value Engineering Service Provide?

1. Partnership: TSN will partner with the project team to recommend the best solutions to fit project conditions. Our services apply at any point in the project; from the Architect, Engineer of Record, General Contractor, Sub-Contractor, Specialty Engineer (Shop Drawer), to the Distributor. Each member of the team can partner with TSN to determine the best course of action for the project.

2. Budgeting/Cost Certainty: TSN's expertise may enable over-budgeted projects to meet budget, and may also provide substantial savings to projects already within a posted budget. TSN's VE services have provided significant savings in the wall system as well as in the secondary systems, such as foundations.

3. Flexibility: The project design team is empowered to determine the best foundation, floor, and roof systems for the project.

4. Scheduling: TSN's VE services often result in accelerated construction schedules which, in turn, save resources.

Optimizing the Structure

The Steel Network's load bearing wall systems (LBWS) create the opportunity to fully-optimize the structural systems, including walls, floors, and the building's foundation. Use of SigmaStud® (8psf) in place of the much heavier concrete/masonry block (45psf) enables the Structural Engineer to determine if a more efficient foundation, including the elimination of geo-piers is possible. "Real world" experience proves time and time again the tremendous value TSN's LBWS delivers to the construction team.

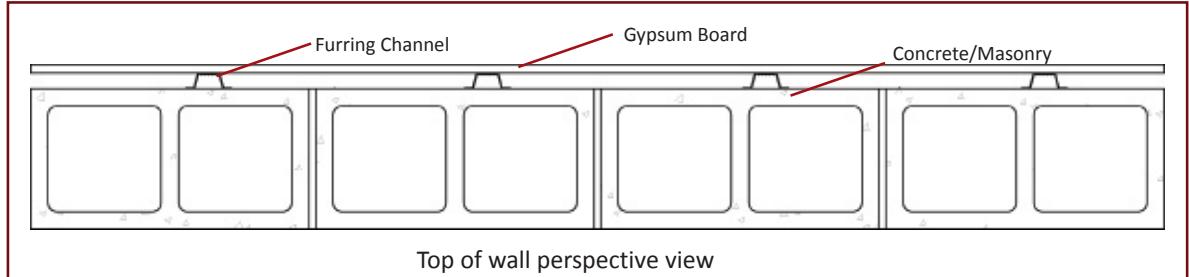

TSN's Load Bearing Wall Systems provide approximately \$2/sq.ft. of material cost savings *in addition to* the significant time/labor savings related to scheduling and installation.

Electrical Consideration

In concrete/masonry walls, electrical wires are installed on both sides of the masonry in gaps provided by some type of furring channel. This adds to the cost of concrete/masonry in the comparison above. This added expense is not seen in TSN's SigmaStud due to the pre-punched knockouts located vertically at 24" o.c.

SigmaStud's punchouts provide a convenient avenue for electrical chase.

Concrete/Masonry walls require additional furring for installation of finishes and wiring.

Load Bearing Wall Members

Temporary Bracing

Temporary Construction Bracing

Temporary construction bracing is necessary in order to install steel framed load bearing wall systems. Coordinate temporary bracing with the Specialty Engineer and/or the General Contractor. Safe and proper installation and "loading" of the walls can only be achieved if the adequate temporary bracing is installed. **Failure to do this can result in wall failure and/or the risk of serious injury.**

Two types of construction bracing are required:

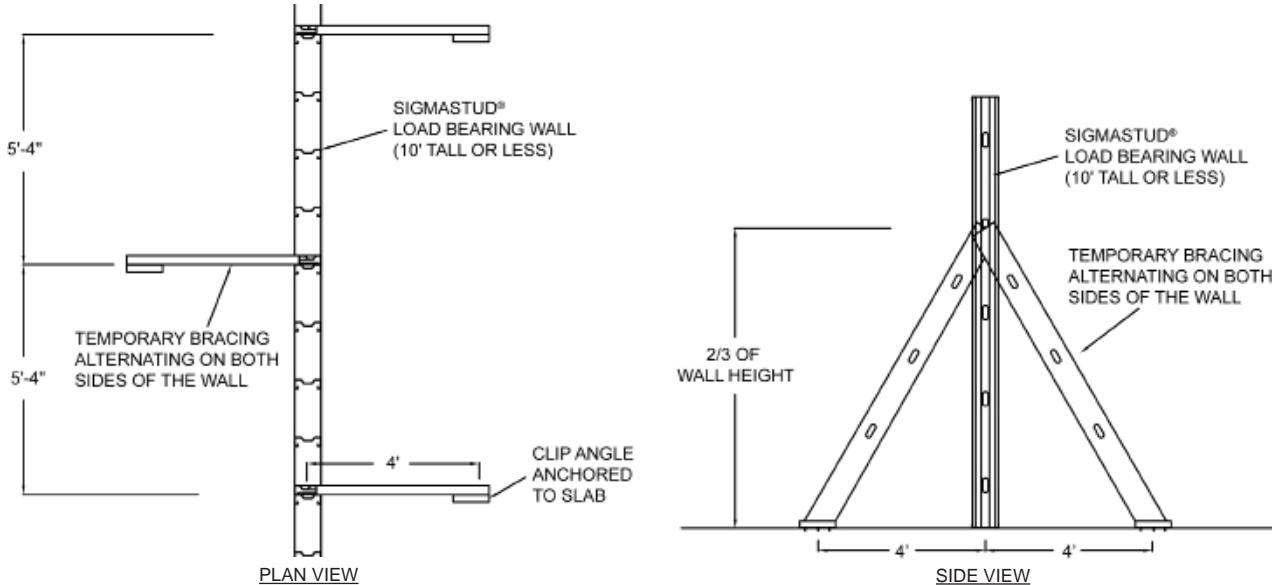

- In the plane of the wall (may employ the X-bracing of the shear wall panels and/or by adding diagonal kickers at the two ends of the wall).
- Out of the plane of the wall.

When should temporary construction bracing be removed?

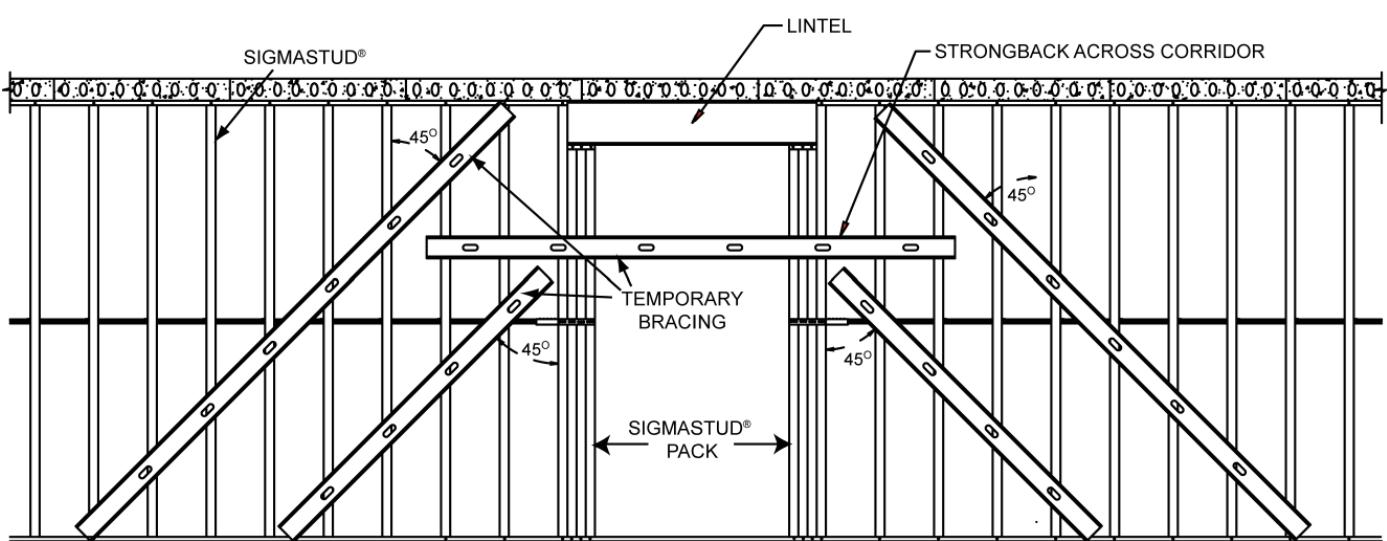

- After at least 2 floors above the temporarily braced wall are installed, allowing the walls to "seat".
- After all permanent shear wall bracing is installed and tightened.
- After all of the perpendicular walls are connected.

Suggested Minimum Construction Bracing for Load Bearing Wall 10' or Less, Out-of-Plane

* Temporary bracing should be designed by a design professional.

Suggested Minimum Construction Bracing for Load Bearing Wall: In-Plane at Corridor

Additional temporary bracing details are available at www.steelnetwork.com

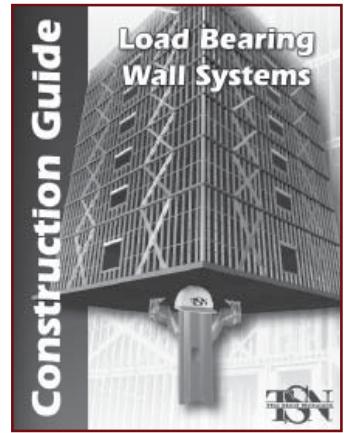

Load Bearing Wall Members

Construction Guide

Description

TSN's Load Bearing Wall Systems Construction Guide provides an in-depth look into a variety of design and installation conditions concerning use of SigmaStud® and StiffWall® in construction projects. The purpose of the guide is to educate contractors, architects and engineers on the proper use of TSN's load bearing wall systems on the job site. The Steel Network wants to ensure that our customers fully understand these systems and are supplied with detailed information addressing installation issues, including the following:

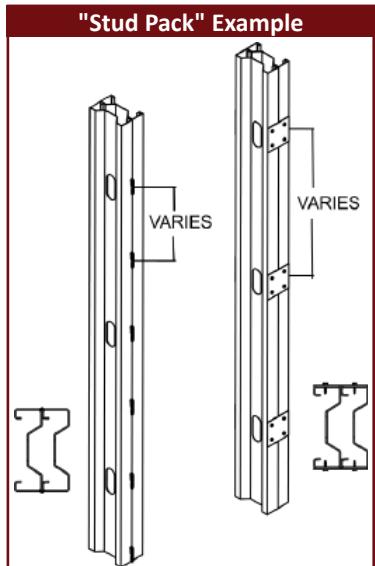

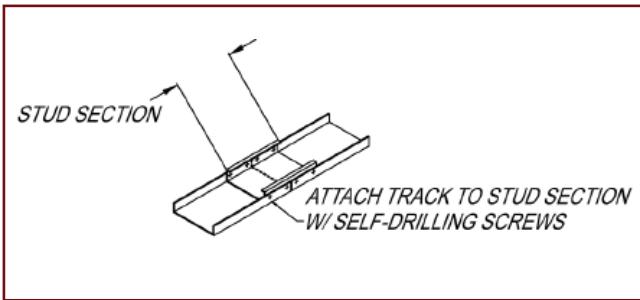

- SigmaStud installation to the top and bottom tracks
- Track recommendations
- Shims
- Reinforcing non-standard holes in SigmaStud
- Temporary construction bracing
- Corridor framing
- Panelized walls
- Key wall bridging issues

Track Reinforcement

The top and bottom wall tracks in contact with hollowcore planks need to be continuous. The contractor must provide track splicing if the tracks are cut.

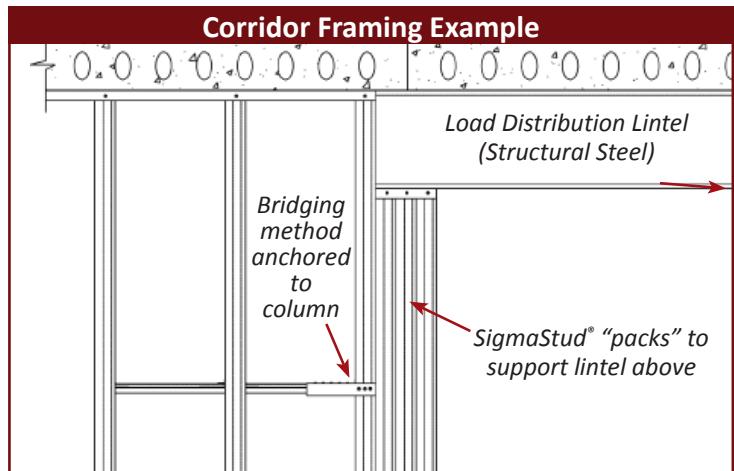

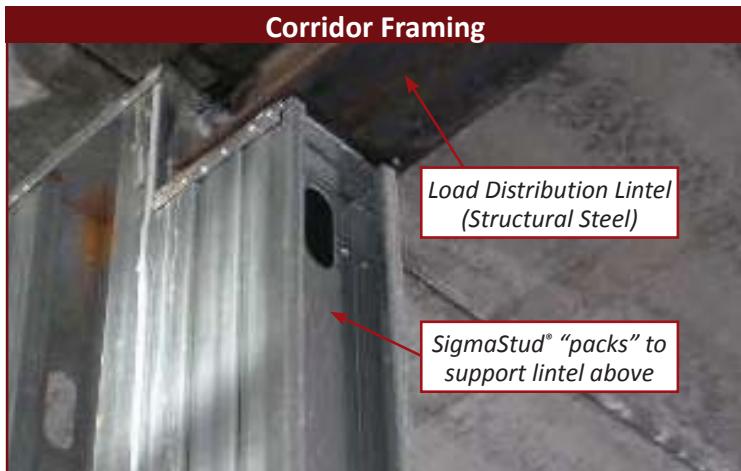

- To splice track in a load-bearing wall, an extra piece of stud must be used inside the track to sufficiently overlap each side of the joint. 2-3 screws are then installed through the flanges on each side of the joint, on both sides of the track (for a total of 8-12 screws per splice).
- In adjacent walls ending with edge studs, a plate may be screwed or welded across the flanges of the end studs of two adjacent walls. In addition to this, the studs must be screwed or welded together per standard column/screw guidelines.

Corridor Framing

In applications where the plank spans bays that are parallel to the corridor, plank direction can be maintained in the corridor through the use of a load distribution lintel. Structural steel is commonly used to act as the lintel to support the opening, resulting in increased point loads acting on the columns. Bearing requirements for various types of structural steel vary and must be satisfied.

- Typically, multiple studs of the same thickness are used in "stud-packs" to provide bearing points for structural steel lintels.
- Coordinate the use of "stud packs" with the structural engineer.

Load Bearing Wall Members

Construction Guide - Wall Studs

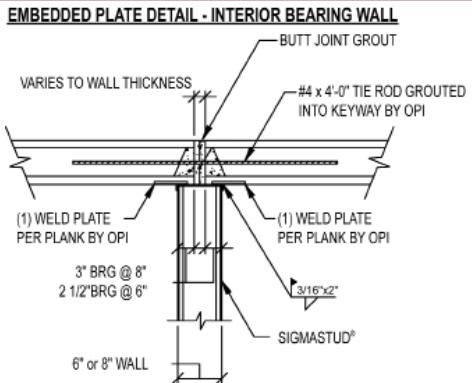

Embedded Plates

If the floor system consists of hollow core planks:

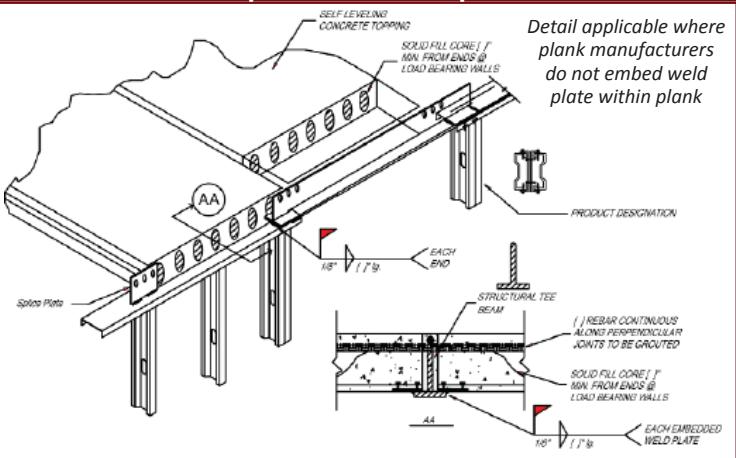

- Typically attach the top track to the floor above by welding the bottom of a key plate (Splice Plate) to the track.
- The key is then grouted in between the two planks, connecting the floor system to the rest of the structure.
- Embedded bolts/anchors and power actuated fasteners can also serve to connect the load bearing walls with various floor diaphragms, per the structural engineer's specifications.
- Be sure to clarify specific methods of attachment with the engineer.

Visit www.steelnetwork.com for a copy of the Construction Guide!

EMBEDDED PLATE DETAIL - EXTERIOR BEARING WALL

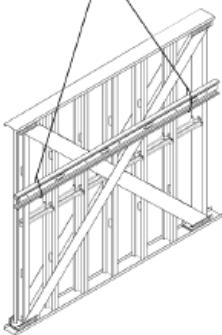

Wall Panel Handling

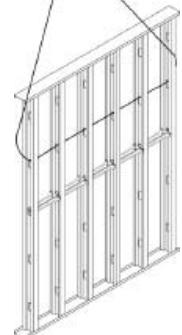

When lifting wall panels into place, **avoid using the bridging as a lift point**. This could bend the bridging members, rendering them ineffective. Here are two suggestions that have worked well in existing installations:

- Attach a temporary stud or other bracing member ("strong back") horizontally across the wall panel and use it to lift the wall sections into place.
- Thread the cables through the stud punchouts at either end to lift the panel.

Strong Back

Threaded Cable

Bridging Example Problem

Design Example

Using AISI Wall Stud Design Standard (2007) requirements, design BuckleBridge® lateral bracing system for an 8 ft. tall CFS load bearing wall. The wall consists of 800SG200-54 studs spaced at 16 inches o.c.

Solution

- a) Design compression load per stud, $P = 11.5$ kips:

From SigmaStud charts, 8 ft. Wall Height, No Lateral Load:

One row of lateral bracing, unbraced length $L_b = 48$ inches

800SG200-54, Allowable strength $P_a = 12.28$ kips

- b) Required bridging strength for a single SigmaStud:

$$P_{br,1} = 0.02(11.5 \text{ kips}) = 0.23 \text{ kips}$$

- c) Check the strength of BuckleBridge:

Since the bridging row can resist lateral bracing forces either in compression or in tension, the maximum wall length that can be braced before anchorage is determined from the load capacity of BuckleBridge in compression and tension as follows:

Maximum number of studs that can be braced in **compression**

$$= \text{BuckleBridge } P_{Comp} / P_{br,1}$$

$$= 2.4 \text{ kips} / 0.23 \text{ kips} = 10 \text{ studs}$$

Maximum number of studs that can be braced in **tension**

$$= \text{BuckleBridge } P_{Tension} / P_{br,1}$$

$$= 0.44 \text{ kips} / 0.23 \text{ kips} = 1 \text{ stud}$$

Maximum number of studs that can be braced before anchorage

$$= (10 + 1 + 1) \text{ studs} = 12 \text{ studs (see chart below)}$$

The lateral bracing needs to be anchored at rigid columns every 12 studs = 16 ft 0 in.

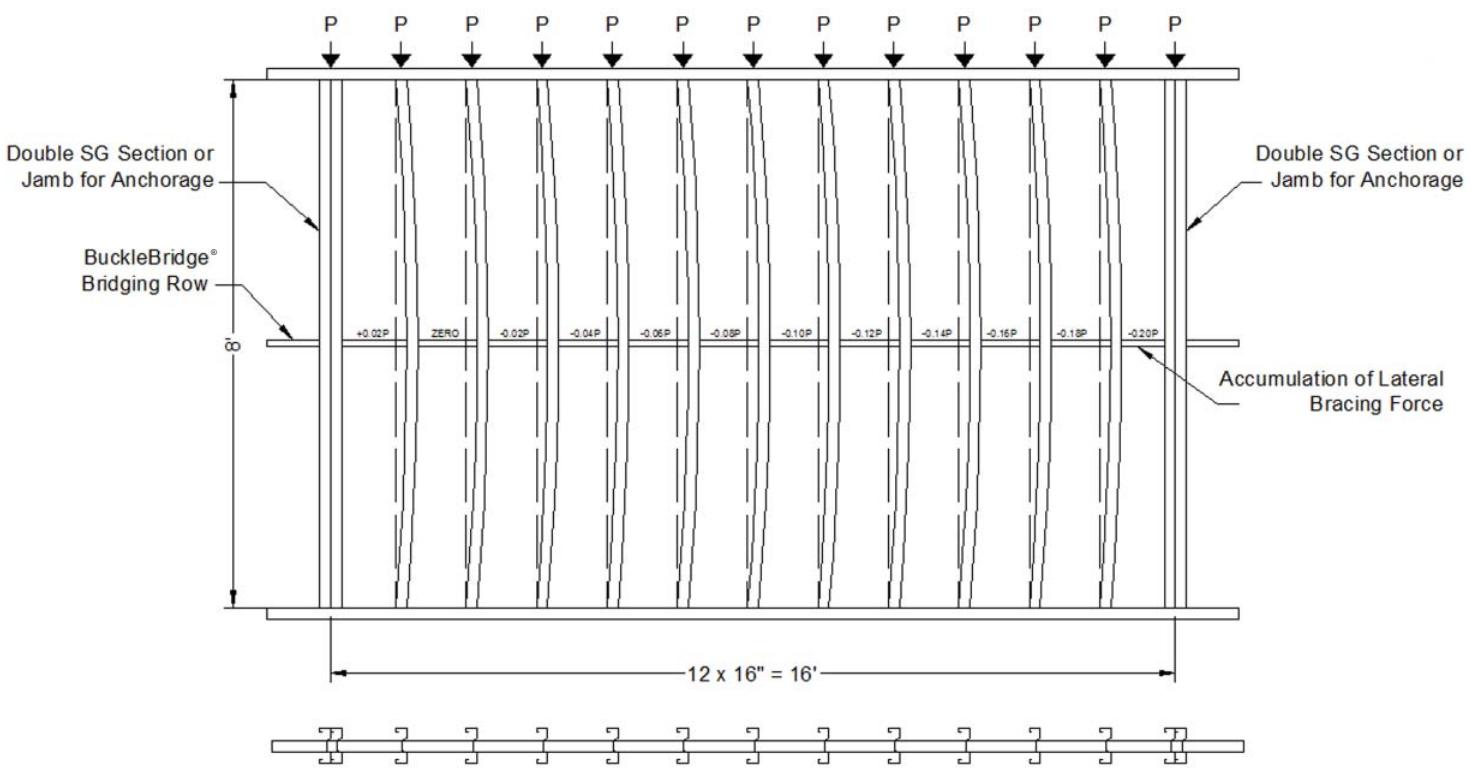

Use double SigmaStud® section or JamStud® section as a rigid column at anchorage locations (see anchorage details).

Design rigid columns for a lateral force = 12×0.23 kips = 2.76 kips

Alternatively, use cross-bracing to floor system as the anchorage method (see anchorage details).

Note: AISI S100-07 requires less capacity for the lateral bracing (bridging) row, but mandates additional stiffness requirements. Check BuckleBridge stiffness capacity.

fractions of inches.

Background

StiffWall® SWS is a stick build system designed to carry loads concentrically from the point of applied loads to the foundation or other termination point, that utilizes light gage straps on both sides of the wall for shear resistance. StiffWall provides superior quality with high yield ASTM A1003 steel and hot-dipped galvanized coating for long-term durability. It is specified using simple nomenclature indicating only essential design requirements for each shear wall element. The design is ideal for job specific sizes with established load requirements. The Steel Network has optimized the design and fabrication of StiffWall through a series of both component and full scale wall assembly tests, using state of the art technology to measure performance.

StiffWall shear walls provide both lateral strength and stiffness. Lateral strength is needed to resist horizontal loads due to wind and earthquake forces. Properly designed and constructed shear walls transfer lateral forces to the next structural element in the load path below them, such as other shear walls, floors, or foundations.

Lateral stiffness is needed to prevent excessive side-sway of the structure. When shear walls are of adequate stiffness, they will maintain the lateral deflection or serviceability requirements of the building. In addition, buildings with sufficient lateral stiffness will suffer less nonstructural damage, further avoiding long-term degradation due to veneer cracking and water infiltration.

StiffWall System Components:

Columns (C/STW)

- End posts for the shear wall
- Wider flange and additional return lips provide an increased load capacity over standard steel stud sections

Boots

- Made up of a Strap Track (97 mil, 12" long track section with pre-punched screw pilot holes) and a Base Plate ("T" shaped structural steel), specified bolts for connection to column, and is designed to fit into a standard size track.
- Transfers the loads from the straps and columns through the floor system down to the foundation
- Pre-installed on top and bottom of each column by TSN
- Fits into a standard track (T) section

Flat Strap

- Runs diagonally (corner to corner) as a single piece and attaches to the strap track in an "X" pattern
- Four (4) pieces of flat strap are used in each StiffWall (2 pcs each side)
- Made to your specifications, always using 50 ksi steel

TightStrap®

- Device used to tension (tighten) flat strap in the field
- Removes "waviness" or "bowing" prior to fastening
- Ensures flat straps are as tight as possible when installed to achieve optimal system performance
- Fastens to standard track at the corners of the shear wall to provide a base for the tensioning process

* The infill studs are not part of the StiffWall system and act independently of the shear wall. The floor slabs are part of the lateral load resisting system, but are not part of TSN StiffWall system.

Load Bearing Wall Members

Shear Wall Systems

Planning Shear Walls

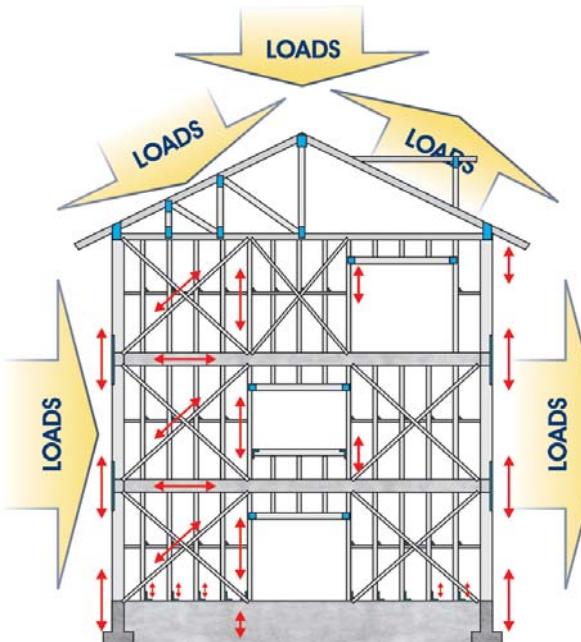

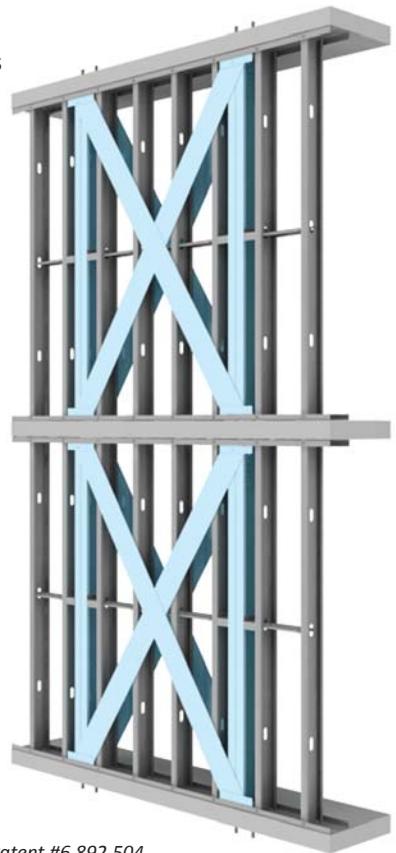

To develop an efficient shear wall layout several factors need to be considered:

- Height to Width aspect ratio guidelines should be observed in order to maximize effectiveness
- Shear walls should be evenly distributed across the floor plan to reduce additional lateral loads resulting from torsional effects on the floor plan
- Shear Walls located in load bearing walls may use floor dead loads with the appropriate load combination to offset uplift forces in the StiffWall
- Walls must stack vertically from top floor of structure to anchorage point or foundation
- Shear walls may overlap when the available wall space has been depleted

StiffWall® Benefits That Add Value

- Templates are not required for hold-downs, eliminating unrealistic field procedures.
- Designed and manufactured to meet the performance requirements of the project.
- Satisfies maximum story drift requirements per IBC.
- Only mill certified high strength steel is used.
- Plywood sheathing with fastener schedules and/or CMU shear walls are eliminated.
- Inspection is limited to simple connections at corners.
- Exceeds industry standards for sizes and loads.
- Versatile design may be incorporated into steel, concrete and wood construction
- Tested for multi-story application and capable of carrying loads present in 10 story buildings.
- No welds or controlled inspections associated with welding.
- Simplified anchoring system through floors and at roof termination.
- Each component is selected to meet or exceed both strength and stiffness requirements of the applicable building code.
- The strap system is on the outside of the wall to facilitate electrical and pipe work in the wall cavity.
- Allows 3 times the window space of plywood braced structures.

Verifying Load Paths

Tracing and verifying load paths through a structure is crucial to protect engineering liability. Loads need to migrate from the roof, through the wall and floor systems, and terminate in the foundation. Shear wall systems transfer lateral loads from the member above (i.e. floor slab) to the member below (i.e. foundation). StiffWall® provides a traceable, easily verifiable load path through the structure.

A Load transfers from the floor above through the floor connector, and to the StiffWall Boot

B From the Boot to the Strap Track*

C From the Strap Track to the flat strap*

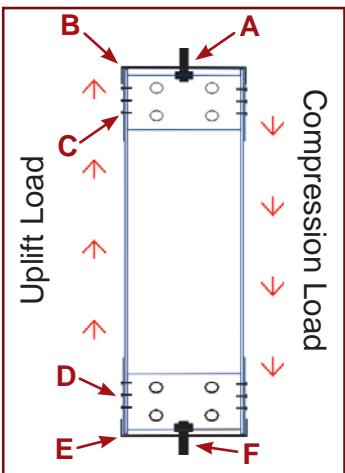

D Through the flat strap to the Strap Track at opposite corner*

E From the Strap Track to the Boot

F From the Boot to the floor/system or foundation below

* The column section assumes the compression loads.

* Uplift forces are transferred through the StiffWall® Boot through full bearing onto the SWS Boot Base Plate to the anchor.

Load Bearing Wall Members

StiffWall® SWS Design

Simple Steps to Design Shear Walls

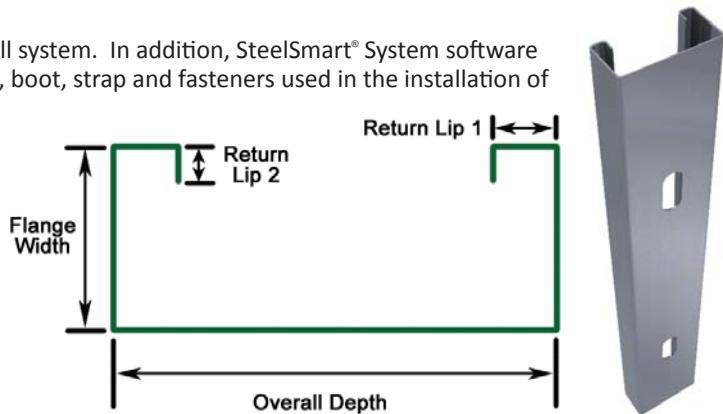

The following pages offer a guide for the design of the StiffWall® shear wall system. In addition, SteelSmart® System software is available ([at www.steelsmartsystem.com](http://www.steelsmartsystem.com)) to select the optimal column, boot, strap and fasteners used in the installation of StiffWall. Contact The Steel Network for additional design information.

Step 1 - Select StiffWall® Column

This unique column contains an additional return lip to form a double lip, thus creating a stronger, more effective bearing section. The column is the main vertical load-bearing transfer element in StiffWall. The images at right show a typical StiffWall Column shape.

Important Note:

The StiffWall Boot must be used with the StiffWall Column. Standard stud (S) sections will not fit inside the StiffWall Boot or Strap Track.

Step 2 - Select StiffWall® Boot

The StiffWall Boot is a critical element enabling StiffWall to simultaneously resist higher loads and provide positive load transfer between elements, something conventional shear wall systems do not provide. Five different StiffWall Boots are available for accommodating changing loading requirements. Refer to the Boot Capacities table data to select the appropriate Boot to fit project conditions.

Step 3 - Determine Column-To-Boot Uplift Fastener Requirement

Attaching to the StiffWall Column with #12 screws or 0.5" A325 bolts, the boot enhances construction efficiency by reducing the number of installed fasteners used in conventional flat strap shear walls. For uplift conditions, calculate the number of screws for the Light Boot by dividing the total uplift force by the single screw shear. For Small, Medium, Transition, and Large Boots, refer to the chart below for the number of fasteners to the column.

Single Column Allowable Uplift Load (T2) (kips)																	
Column Thickness		Light Boot (1) # 12 Screw	Small Boot			Medium / Transition Boot								Large Boot

- Bolts referenced in table are ASTM A325 bolts.

- Refer to the Design Example for uplift requirements.

- Allowable loads for screws are based on AISI S100-07 Specification, Section E4.3.

- Maximum allowable load per (1) #12 screw in shear is equal to 0.849 kips, based on commercial screw data.

- Allowable loads for bolts are based on AISI S100-07, Section E3.3.2.

- Maximum allowable load per (1) A325 bolt in shear is equal to 4.42 kips, based on AISI S100-07, Appendix A, Table E3.4-1.

* Compression loads are transferred via full column bearing onto boot.

Load Bearing Wall Members

StiffWall® SWS Design

Step 4 - Select Stiffwall® Flat Strap

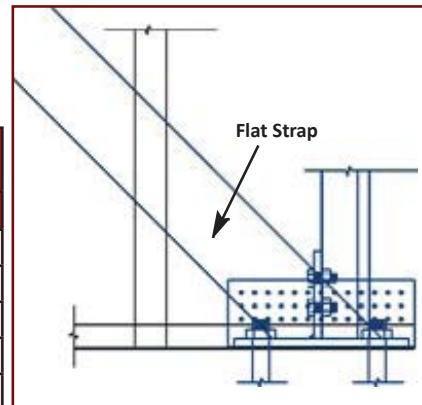

Flat strap is the tension element used to transfer loads between diagonally located strap tracks. Flat strap selection is simplified to 6 strap types (see chart below), with load capacity factored using standard 12ga (97mils) strap track.

Strap Width (in)	Strap Thickness (mil)	Yield Strength (ksi)	Recommended # of screws/ row (#)	Allowable Tension in Single Strap (kips)	No. of #12 Screws for Max. Strap Tension # (kips)
4	54	50	4	5.20	10 (5.7 k)
6	54		6	7.80	14 (7.98 k)
8	54		8	10.39	19 (10.82 k)
8	68		8	13.09	17 (13.20 k)
10	68		10	16.37	22 (17.09 k)

- Screw shear values are based on #12 (0.216") screw attached to 97 mil (12 ga) Strap Track.

- Minimum screw spacing = 3d

- Minimum screw edge distance = 1.5d

It is recommended to limit the use of 10" flat strap to shear wall panels that have aspect ratio > 0.72:1 (36 degrees)

Step 5 - Condition 1: Anchor Design At Foundation

Refer to the Hilti North American Product Technical 2011 Edition Volume 2, page 160 to design anchors at the foundation. For typical details of StiffWall at foundation, see Example Details provided in this catalog. TSN recommends the use of a washer, lock washer, double-nut washer, or tack weld at each end of the bolt.

Allowable Tension and Shear Values of Hilti HIT HY 150 MAX Adhesive Anchors							
Anchor Diameter (in)	Embedment Depth (in)	Tension				Shear (Non Seismic Design)	
		Based on Bond or Concrete $f'_c = 2000 \text{ psi}$		Based on Steel Strength ASTM A193 B7		Based on Bond or Concrete $f'_c = 2000 \text{ psi}$	Based on Steel Strength ASTM A193 B7
$\frac{7}{8}''$	4	3,375	5,300	24,805	7,670	10,840	12,780
	$7\frac{7}{8}$	9,910	14,815		17,175	24,290	
	$10\frac{1}{2}$	14,385	15,345		26,440	37,390	
$1\frac{1}{4}''$	$5\frac{5}{8}$	6,985	9,935	50,620	13,180	18,640	26,080
	$11\frac{1}{4}$	18,345	30,085		35,050	49,570	

- Bond, concrete, and steel values are referenced from Hilti North American Product Technical Guide 2011 Edition Volume 2 and Hilti ICC ESR-1967.
- Apply influence factors for spacing and/or edge distance to concrete/bond values, then compare to the steel strength value. The lesser value is to be used for design.
- Applied tension force shall include tension resulting from prying action produced by deformation of connected parts.
- For design of anchorage under seismic conditions, refer to ACI 318 Appendix D - Anchoring to Concrete provisions.

Step 5 - Condition 2: Through Floor Fastener Connection

Refer to the Hilti North American Product Technical 2011 Edition Volume 2, page 160 to design through floor bolt fasteners. For typical details of StiffWall at top termination (roof) and through floors, see Example Details provided in this catalog. TSN recommends use of a washer, lock washer, double-nut washer, or tack weld at each end of the bolt.

- Ensure full bearing between through-floor bolts and the floor slab. Enlarged or notched bolt holes in the slab must be filled with grout.
- Applied tension force shall include tension resulting from prying action produced by deformation of the connected parts.
- The area of a $\frac{7}{8}''$ bolt = 0.60 in^2 and area of $1\frac{1}{4}''$ bolt = 1.23 in^2 .
- Allowable Shear per one $\frac{7}{8}''$ A325 Bolt = 13.5 kips.
- Allowable Shear per one $1\frac{1}{4}''$ A325 Bolt = 27.7 kips.
- Allowable Tension per one $\frac{7}{8}''$ A325 Bolt = 27.0 kips.
- Allowable Tension per one $1\frac{1}{4}''$ A325 Bolt = 55.2 kips.
- **Boot Base plate guide holes for wall widths less than 5.5" accommodate 7/8" through-rods for light, small, medium, and large boots.**
- **Boot Base plate guide holes for wall widths greater than or equal to 5.5" accommodate 7/8" through-rods for light, small, and medium boots. For large boots the base plate guide holes accommodate 1 1/4" through-rods. To transition from a large boot with 1 1/4" through rods to any other boot type, a transition boot kit is required, which will accommodate 1 1/4" through-rods on the base of wall, and 7/8" through rods at the head of the wall.**

* Reference is AISI S100-07, Section E3.3.2.

Fastening StiffWall® Boot Through Floor

Load Bearing Wall Members

Pre-Assembled Columns/Boots

Order Information

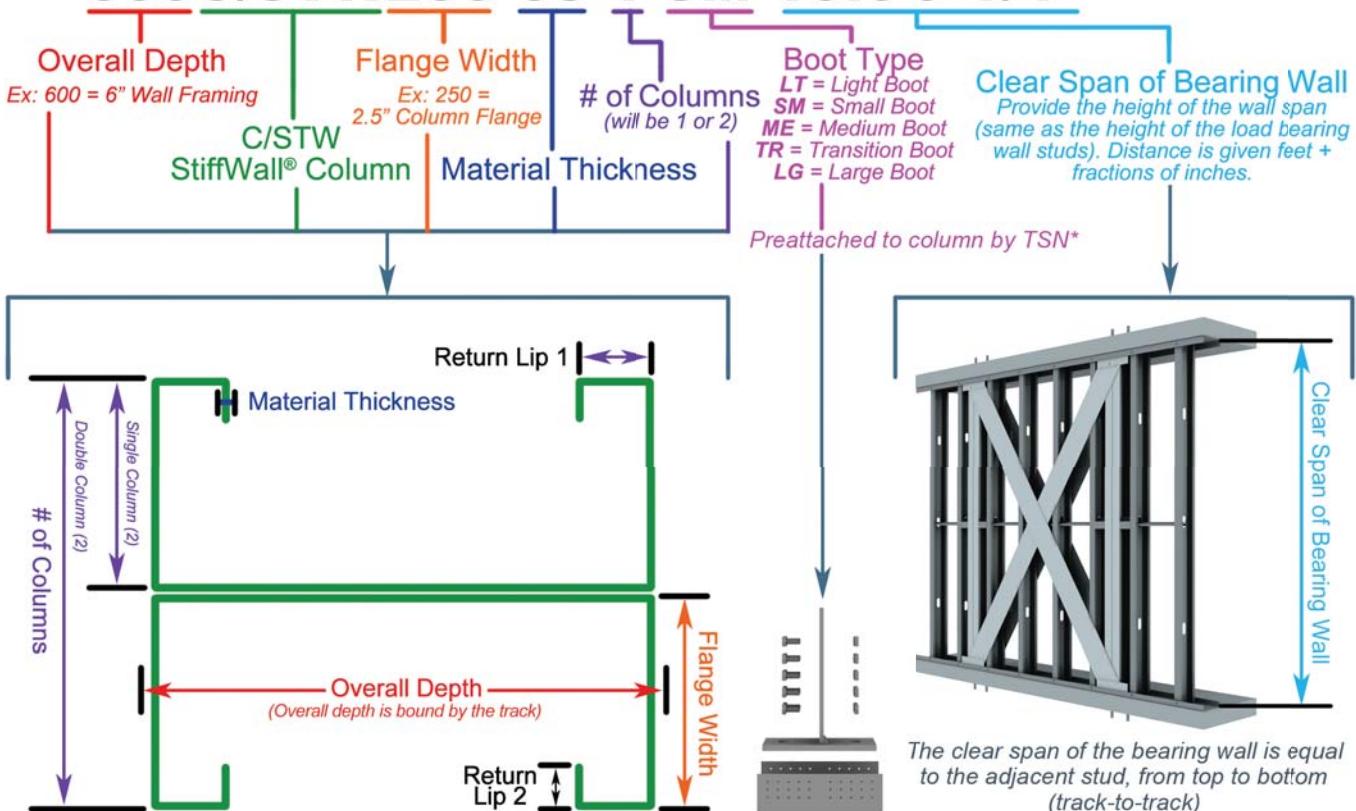

StiffWalls consist of two Column/Boot Assemblies (at each end post) and Flat Strap (2 sides of X-bracing). The StiffWall fits into or is embedded into the load bearing and non-load bearing walls. Do your stud take off as normal and order the Column/Boot Assembly and the Flat Strap as separate items. When ordering columns, determine the height of the bearing wall. TSN will size the StiffWall Column/Boot Assembly factoring in the dimensions of the boots at top and bottom. Each column is shipped with the boots pre-attached at the top and bottom as shown in the image to the right.

The added value of the pre-installed boots minimizes tolerance issues during erection. Simply specify the clear span of the bearing wall system and TSN will ship the Column/Boot assembly to meet the given wall height at a tolerance of +0/-1/8".

Standard (S) section studs will not fit in the StiffWall® Boot and should not be considered as a substitute for the StiffWall Column.

Important Notes

1. Section properties and capacities are calculated in accordance with AISI-S100-07 with 2010 Supplement.
2. Tabulated gross properties are based on the full-unreduced cross section of the studs, away from punchouts.
3. Effective section properties incorporate the strength increase from the cold-work of forming as applicable per AISI S100-07 Sec. A7.2.
4. Net effective section properties are calculated at a cross section through the punchout.
5. For deflection calculations, use the effective moment of inertia.
6. The effective moment of inertia for deflection is calculated at a stress which results in a section modulus such that the stress times the section modulus at that stress is equal to the allowable moment. AISI S100-07 Procedure I for serviceability determination has been used.
7. The StiffWall® Column must be used with the StiffWall Boot. Standard (S) sections will not fit inside the StiffWall boot or Strap Track.

Load Bearing Wall Members

StiffWall® Column Axial Load Tables

Important Notes

- Allowable loads are based on specified weak axis and torsional bracing for axial load calculation.
- Sections are punched with a standard punch-out 1.5" wide located along the centerline of the web 24" o.c.
- Allowable loads are based on a punched section for axial load calculation.
- The allowable axial strength for distortional buckling is based on an assumed $k_y = 0$.
- Weak axis and torsional bracing should have sufficient strength and stiffness to resist the axial load.
- Strength increase due to cold work of forming is incorporated in calculating allowable loads as per AISI S100-07 Sec. A7.2.
- The StiffWall® Column must be used with the StiffWall Boot. Standard (S) sections will not fit inside the StiffWall Boot or Strap Track.
- StiffWall Columns are delivered to the job site with Boots pre-attached at the top and bottom for fast installation.

Single Section Table

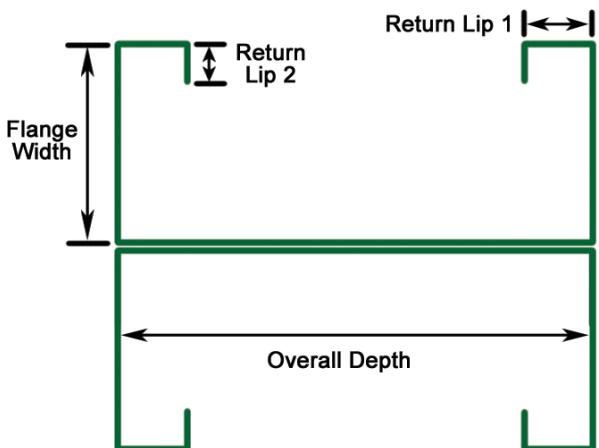

Section (All 50 ksi)	Maximum Unbraced Length = 48"						Maximum Unbraced Length = 60"					
	SW Column Height (ft)						SW Column Height (ft)

Load Bearing Wall Members

Important Notes

1. Allowable loads are based on specified weak axis and torsional bracing for axial load calculation.
2. Sections are punched with a standard punch-out 1.5" wide located along the centerline of the web 24" o.c.
3. Allowable loads are based on a punched section for axial load calculation.
4. The allowable axial strength for distortional buckling is based on an assumed $k_0 = 0$.
5. Weak axis and torsional bracing should have sufficient strength and stiffness to resist the axial load.
6. Strength increase due to cold work of forming is incorporated in calculating allowable loads as per AISI S100-07 Sec. A7.2.
7. Allowable loads for double sections are based on maximum attachment interval of 24" o.c. via weld, bolts, or screws.
8. The StiffWall® Column must be used with the StiffWall Boot. Standard (S) sections will not fit inside the StiffWall Boot or Strap Track.
9. StiffWall Columns are delivered to the job site with Boots pre-attached at the top and bottom for fast installation.

Load Bearing Wall Members

StiffWall® Boots

Boot Dimensions And Thickness

StiffWall® Boots are designed to provide the optimal cost-effective solution for shear wall connections. Five configurations are available to meet project requirements (Light, Small, Medium, Transition and Large). StiffWall Boots are sized to fit inside standard track and are available for 3.5", 3.625", 4", 5.5", 6" and 8" Depths. ***During installation of StiffWall Boots, standard or plate washer shall be used with a size sufficient to cover the Boots' slots after installation.*** The Steel Network will determine the actual bearing height the StiffWall Columns, which are delivered to the job site with Boots pre-attached at the top and bottom for fast installation.

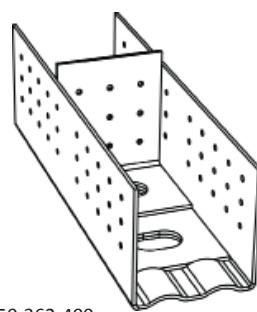

StiffWall® Strap Track

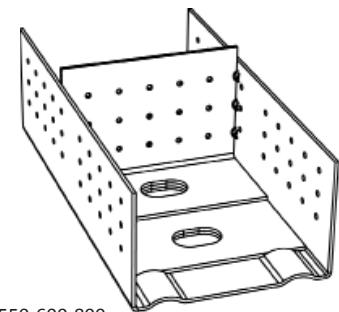

The StiffWall® Strap Track is available in 12ga (97mils) thickness.

Center hole is for conditions where only one anchor is necessary

Light Boot

350-362-400
Depths

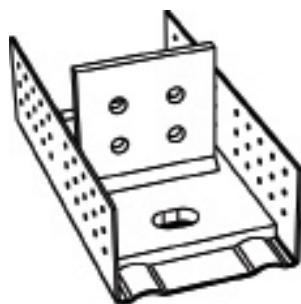

550-600-800
Depths

Small Boot

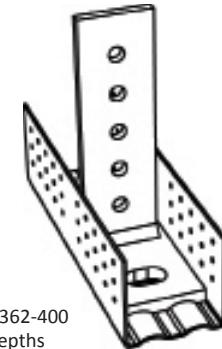

350-362-400
Depths

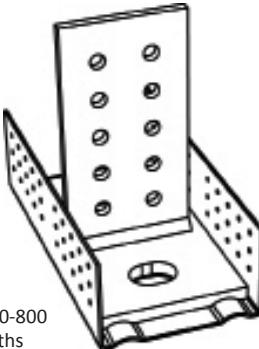

550-600-800
Depths

Medium Boot

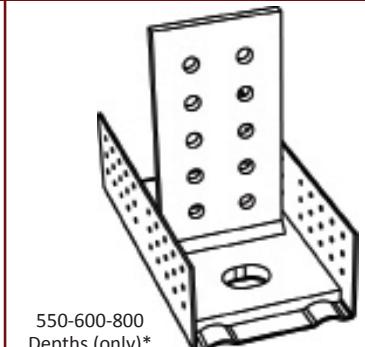

350-362-400
Depths

550-600-800
Depths

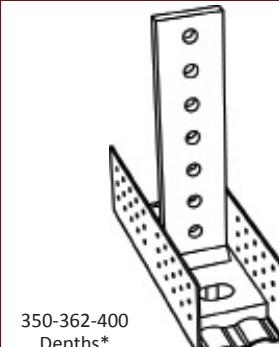

Transition Boot

The StiffWall Transition Boot is used when the floor above uses a Medium Boot and the floor below uses a Large Boot (for depths greater than 4" only). The anchor hole of the Transition Boot at the base of the wall couples with that of the Large Boot at the underside of the floor below to maintain the continuity of the through-floor fasteners (1 $\frac{1}{4}$ " threaded rods or anchors).

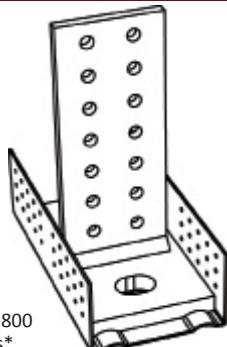

550-600-800
Depths (only)*

Large Boot

350-362-400
Depths*

550-600-800
Depths*

* Boots less than or equal to 4" contain guide holes for $\frac{7}{8}$ " anchors. Boots greater than 4" contain guide holes for 1 $\frac{1}{4}$ " anchors.

Subtract Boot Thickness to Determine Column Bearing Height

The Steel Network will determine the actual bearing height of a StiffWall Column by subtracting the thickness of the StiffWall Boot and Strap Track elements on which it is bearing. For each boot, the StiffWall Strap Track is 97mils thick. The dimensions of various boot elements are shown in the table below. Contact TSN for design recommendations or assistance with any light steel framing technical issue.

Boot Type	Strap Track Thickness	Base Plate Thickness	Additional Base Plate Thickness	Total Thickness of Two Boots ¹
Light	0.1017"	0	0.1242"	0.5"
Small, Medium, Transition	0.1017"	0.5"	0	1.25"
Large	0.1017"	0.75"	0	1.75"

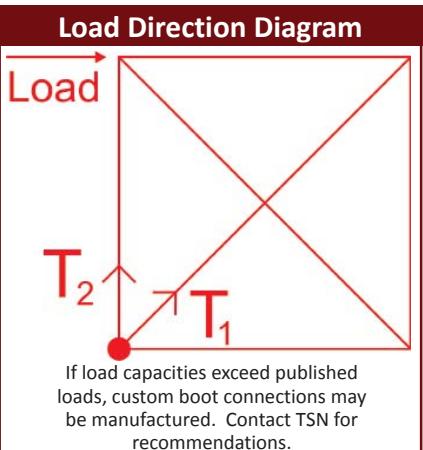

¹ Total thickness rounded to nearest $\frac{1}{32}$ ", with $\frac{1}{32}$ " added for installation tolerance.

Load Bearing Wall Members

StiffWall® Boots

Important Notes

- Allowable loads are based on analysis of loads and allowable stresses set by AISI S100-07 and AISC 2005 Spec.
- Straps tension T1 is the summation of tension forces in the two diagonal straps.
- Load paths for straps tension and column uplift are independent in the boot connection and allowable loads T1 and T2 can be combined for the same boot.
- Check combined tension and shear in anchor bolts due to applied T1 and T2 values as per AISC 2005 Specification, Sec. J3.7.
- Allowable loads for wall aspect ratio other than listed can be interpolated, but not extrapolated.
- Material Designation for cold-formed steel parts is ASTM A 1003/A 1003M, ST50H or equivalent (Min. F_y = 50 ksi, Min. F_u = 65 ksi).
- Material Designation for structural steel parts is ASTM A 572/A 572M, Grade 50 or equivalent (Min. F_y = 50 ksi, Min. F_u = 65 ksi).
- Fillet Weld Designation is E70XX Metal Arc or equivalent. Thickness as specified.
- For seismic design with coefficient R > 3, consider connection special seismic requirements in AISI-Lateral Standard 2004.

Each boot kit contains:

StiffWall Base Plate
Quantity: 4*

A325 Column Bolts
Quantity: TBD per Boot Type**

Strap Track
Quantity: 4

Boot Kits

If field conditions preclude the use of pre-installed Column/Boot Assemblies, StiffWall Boots may be sold as "kits," not individual boots (there are four (4) boots per kit).

- If the project contains 10 StiffWall shear walls, order 10 Boot Kits (not 40 Boot Kits).
- There are 5 different Boot types available: "Light," "Small", "Medium", "Transition", and "Large"

* A Transition Boot Kit contains 2 Medium Base Plates, 2 Transition Base Plates, 4 Strap Tracks, and required A325 Column Bolts.

** One bolt provided per hole into stud.

StiffWall® SWS Example Problem

Sample Structure

The following example is used to illustrate the design capabilities of The Steel Network's StiffWall® SWS system. The designer can specify load rated, tested shear wall assemblies. The information contained within this catalog shows the step by step design process used to design TSN's StiffWall.

Certain assumptions are made within the catalog and example problem. All analyses are shown for example only and do not replace specific loading requirements or load combinations. Please contact The Steel Network for further information.

The example to the right utilizes StiffWall in the construction of a 5-story structure. Loads and reactions at each story have been provided as well as overall foundation reactions. Two load cases were examined (1) Dead + In-plane Wind; (2) Dead + 0.75 In-plane Wind + 0.75 Live.

Dead + In-plane wind loads are the controlling forces in this example. The wall depth is 6" and bridging is provided 48" on center max.

StiffWall does not transfer load between floors. Sufficient diaphragm stiffness or an additional compression member is required to transfer the load.

Important Considerations:

- Uplift and tension loads in StiffWall columns are calculated with 1/2 width or 5' tributary width (tension and uplift calculations only).
- Boundary members (columns) of SWS system in compression must be adequately laterally braced for that compression force (in this design example at 48" o.c.) See the bridging design example for details of lateral bracing calculations.
- StiffWall does not substitute for floor rigidity. Provide a compression member between StiffWall columns or ensure that floor diaphragm is sufficient for compressive loads between floors.
- Floor summaries on the next page refer to the design steps previously given. Step 5 is designed by others.
- f_c of foundation concrete = 4,000psi

Assumptions

Stud Spacing = 24" o.c.

Dead Load = 0.5K/ft

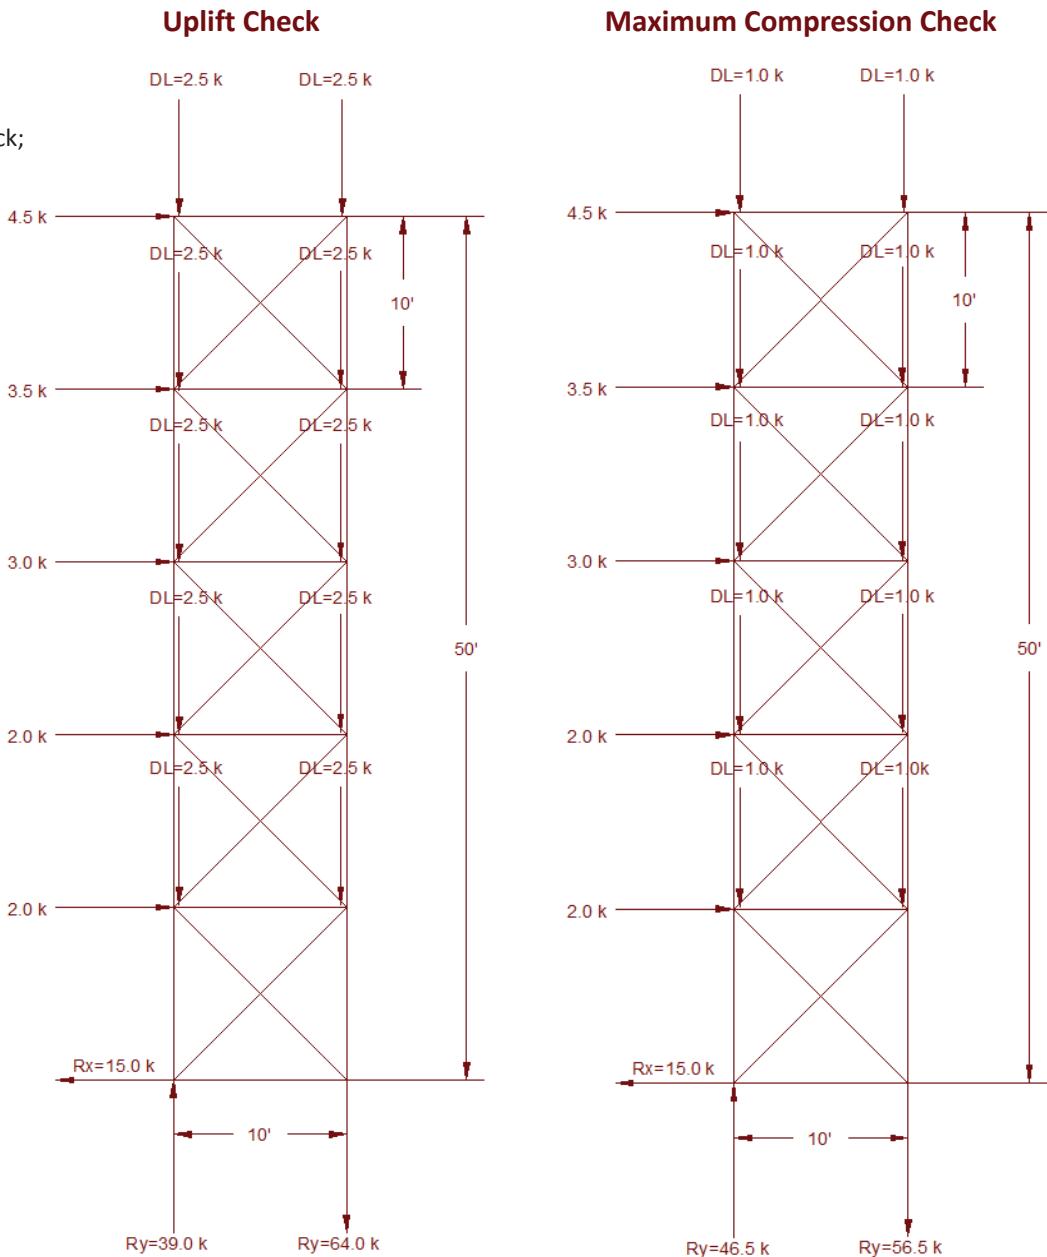

Live Load = 0.75K/ft

Tributary Width = 2.0' Compression Check;

5'0" Uplift Calculation

D + W Checked

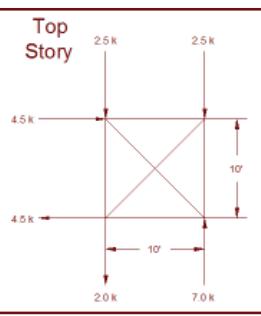

D + 0.75L + 0.75W Checked

Load Bearing Wall Members

StiffWall® SWS Example Problem

Uplift Check

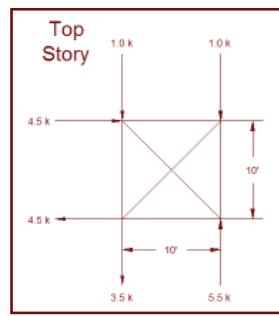

The Top Story Shear Wall Will Have The Following Loads From Analysis:

- Column compression: 5.5 kips
 - Use 600C/STW250-43 with allowable capacity = 6.46 kips > 5.5 kips
- Use StiffWall® Small Boot with capacity of 19.781 kips (T1)
- Attach StiffWall Small Boot to column using (4) ½" A325 bolts
- The tension in the flat strap is: 6.36 kips / 2 = 3.18 kips per strap:
 - Use 4" - 54mil strap with capacity = 5.197 kips > 3.18 kips
 - Use (6) #12 screws with capacity = 3.42 kips > 3.18 kips

Note: No uplift/tension in column

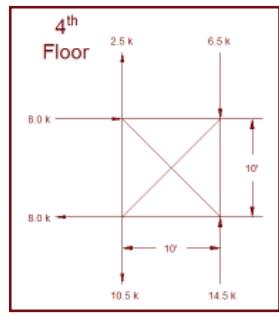

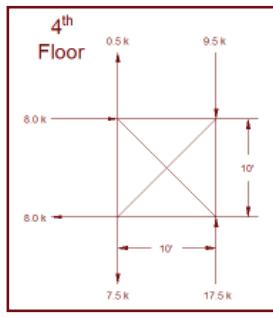

Max. Compression Check

The 4th Floor Shear Wall Will Have The Following Loads From Analysis:

- Column compression: 14.5 kips
 - Use 600C/STW250-97 with allowable capacity = 18.81 kips > 14.5 kips
- Use StiffWall Small Boot with capacity of 19.781 kips (T1)
- Attach StiffWall Small Boot to column using (4) ½" A325 bolts
- The tension in the flat strap is: 11.3 kips / 2 = 5.65 kips per strap:
 - Use 6" x 54 mil strap with capacity = 7.796 kips > 5.65 kips
 - Use (10) #12 screws with capacity = 5.7 kip > 5.65 kips

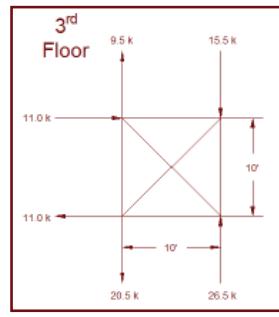

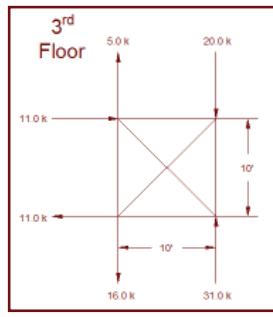

Note: No uplift/tension in column

The 3rd Floor Shear Wall Will Have The Following Loads From Analysis:

- Column compression: 26.5 kips
 - Use (2) 600C/STW250-68 with allowable capacity = 27.25 kips > 26.5 kips
- 5 kips uplift/tension in column*
 - Use StiffWall Small Boot with capacity of 19.781 kips (T1); 15.317 kips (T2)
- Attach StiffWall Small Boot to column using (4) ½" A325 bolts
 - Capacity of (4) ½" A325 bolts to 68 mil columns = 15.539 kips > 5 kips (T2)
- The tension in the flat strap is: 15.56 kips / 2 = 7.78 kips per strap:
 - Use 6" - 54 mil strap with capacity = 7.796 kips > 7.78 kips
 - Use (14) #12 screws with capacity = 7.98 kips > 7.78 kips

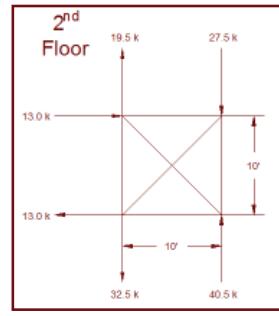

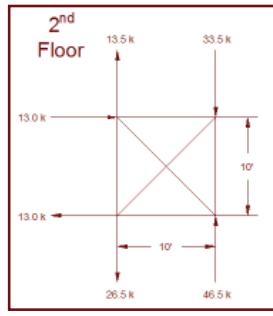

* Uplift calculated using 5' tributary width and dead load used to offset uplift at the tension side of the wall

The 2nd Floor Shear Wall Will Have The Following Loads From Analysis:

- Column compression: 40.5 kips
 - Use (2) 600C/STW250-97 with allowable capacity = 43.92 kips > 40.5 kips
- 13.5 kips uplift/tension in column*
 - Use StiffWall Transition Boot with capacity of 19.781 kips (T1); 17.406 kips (T2)
- Attach StiffWall® Transition Boot to column using (6) ½" A325 bolts
 - Capacity of (6) ½" A325 bolts to 97 mil columns = 26.507 kips > 13.5 kips (T2)
- The tension in the flat strap is: 18.4 kips / 2 = 9.2 kips per strap:
 - Use 8" x 54 mil strap with capacity = 10.394 kips > 9.2 kips
 - Use (17) #12 screws with capacity = 9.70 kip > 9.2 kips

* Uplift calculated using 5' tributary width and dead load used to offset uplift at the tension side of the wall

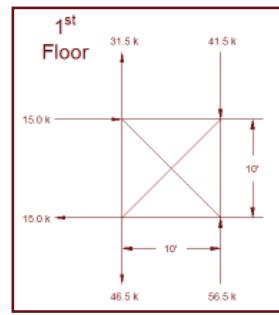

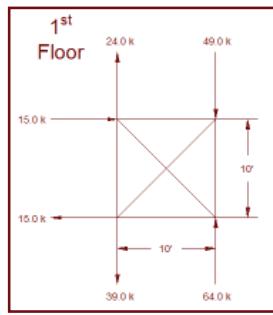

The 1st Floor Shear Wall Will Have The Following Loads From Analysis:

- Column compression: 56.5 kips
 - Use (2) 600C/STW250-118 with allowable capacity = 55.51 kips ≈ 56.5 kips
- 24.0 kips uplift/tension in column*
 - Use StiffWall Large Boot with capacity of 25.339 kips (T1); 39.164 kips (T2)
- Attach StiffWall Large Boot to column using (14) ½" A325 bolts
 - Capacity of (14) ½" A325 bolts to 118 mil columns =
 $61.850 \text{ kips} > 24.0 \text{ kips}$ (T2)
- The tension in the flat strap is: 21.2 kips / 2 = 10.6 kips per strap:
 - Use 8" x 68 mil strap with capacity = 13.094 kips > 10.6 kips
 - Attach strap to strap track with (14) #12 screws with capacity =
 $11.3 \text{ kip} > 10.6 \text{ kips}$

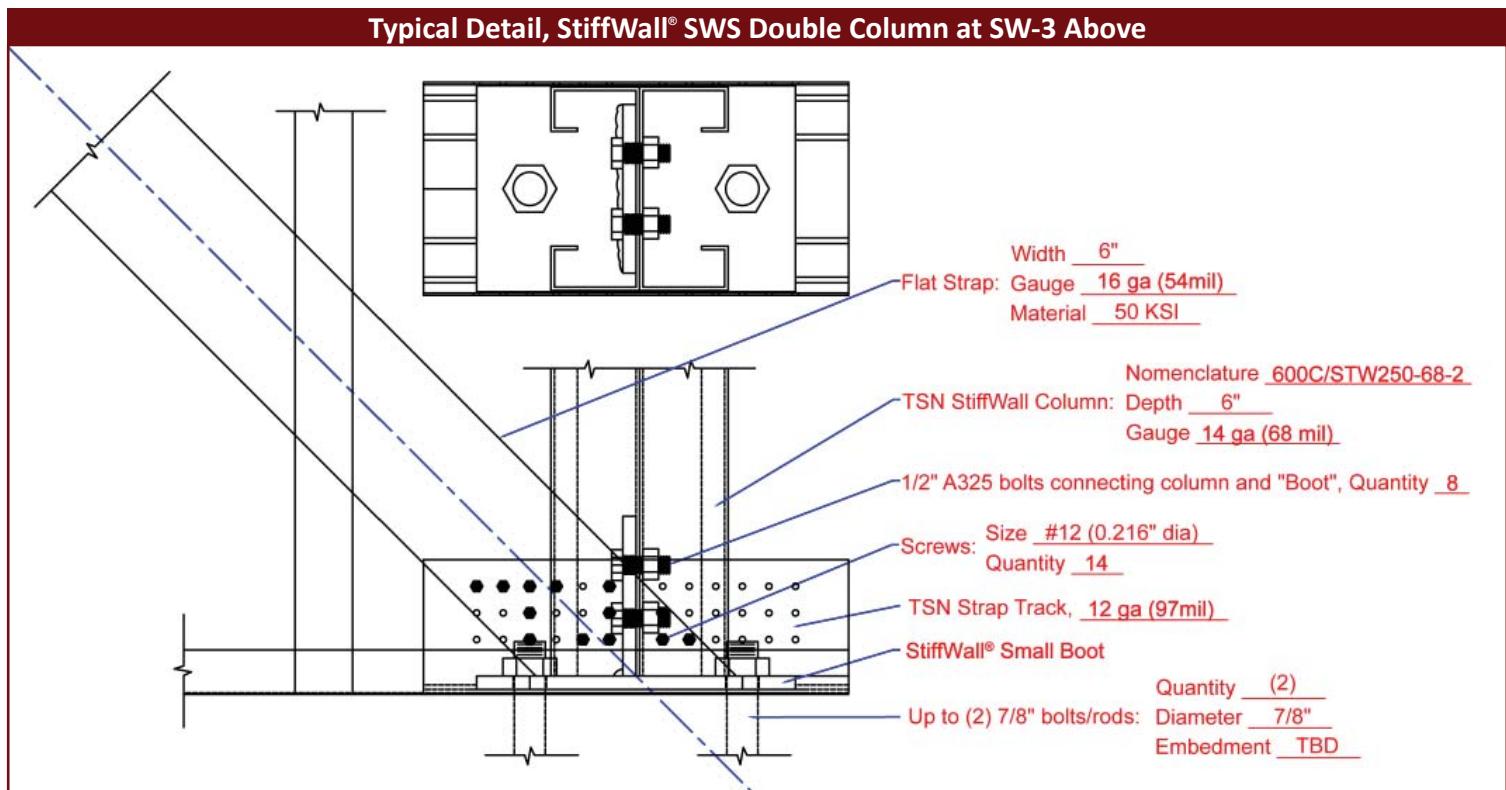

* Uplift calculated using 5' tributary width and dead load used to offset uplift at the tension side of the wall

Anchorage: Use (2) 1 ¼" Hilti HY 150 MAX Adhesive Anchors, 11 ¼" Embedment Depth; check additional tension from prying action

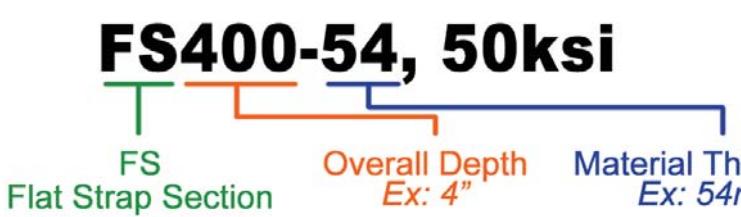

StiffWall® SWS Schedule										
Wall #	StiffWall® Column Section	Compression Load (kips)	Allowable Compression (kips)	Boot Kit	# of 1/2" A325 Bolts to Column	Strap (50ksi)	#12 Screws (each side)	Tension in Flat Strap (kips)	Connection Capacity at Flat Strap to Boot (kips)	Allowable Strap Load (kips)

FS300-43, 50 ksi	3	18	0.0451	0.0428	0.135	0.460
FS300-54, 50 ksi	3	16	0.0566	0.0538	0.170	0.578

Table Notes:

- Section properties and capacities are calculated in accordance with AISI-NASPEC 2007.
- Structural framing is produced to meet or exceed ASTM C955, A653, and A1003.
- Non-Structural framing is produced to meet or exceed ASTM C645, A653, and A1003.
- Galvanized sheet steel meets or exceeds requirements of ASTM A924 & A1003.

Order Information for StiffWall Flat Strap

The Selection of flat strap for StiffWall is simplified to 6 strap types, with load capacity factored using standard 12ga (97mil) strap track (see Step-By-Step Design Procedure on TSN's StiffWall product page for Allowable Flat Strap Capacity Chart). Flat Strap is cut to length with square ends, and will need to be cut to final length in the field. To determine the length of the flat straps, follow these simple steps:

- Find the width (A) and the height (B) of the StiffWall.
- Then, use the following formula to determine the length of the strap: $A^2 + B^2 = C^2$
- Next, take the square root of C, round up to the nearest whole number and add 1

This will result in a length in feet that you can work with. If C equals a whole number, you may want to add 2 to make sure the length is enough.

Example: 8' wall height with a width of 16' would look like this: $(8 \times 8) + (16 \times 16) = \sqrt{320} = 17.88$
Round up to 18' and add 1' for a strap length of 19'.

Some points to remember concerning Flat Strap:

- Flat strap can not be installed, un-installed, and then re-installed (A new piece of strap is required).
- Strap must be pulled tight after a gravity load above has been applied.
- Do not fasten the strap to the infill studs between the columns.
- Straps should not be spliced without an approved design.
- Four (4) pieces of strap are required in each StiffWall (If there are 10 StiffWall shear walls, 40 pieces of flat strap will be necessary)

Load Bearing Wall Members

Tightstrap®

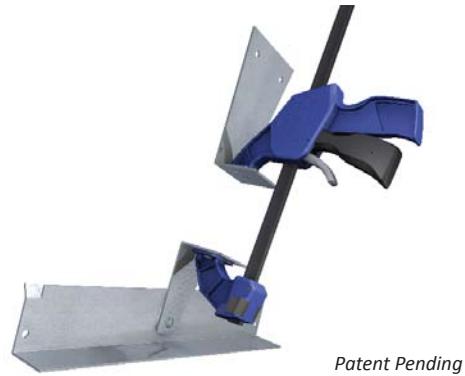

Product Description

The pre-tensioning of a shear wall flat strap provides a means to ensure the shear wall will perform as designed. It is important that the flat straps are as tight as possible when installed to achieve optimal system performance.

TightStrap® is a unique device used to tension (tighten) flat strap in the field. Use TightStrap to improve structural performance of a shear wall by removing "waviness" or "bowing" prior to fastening.

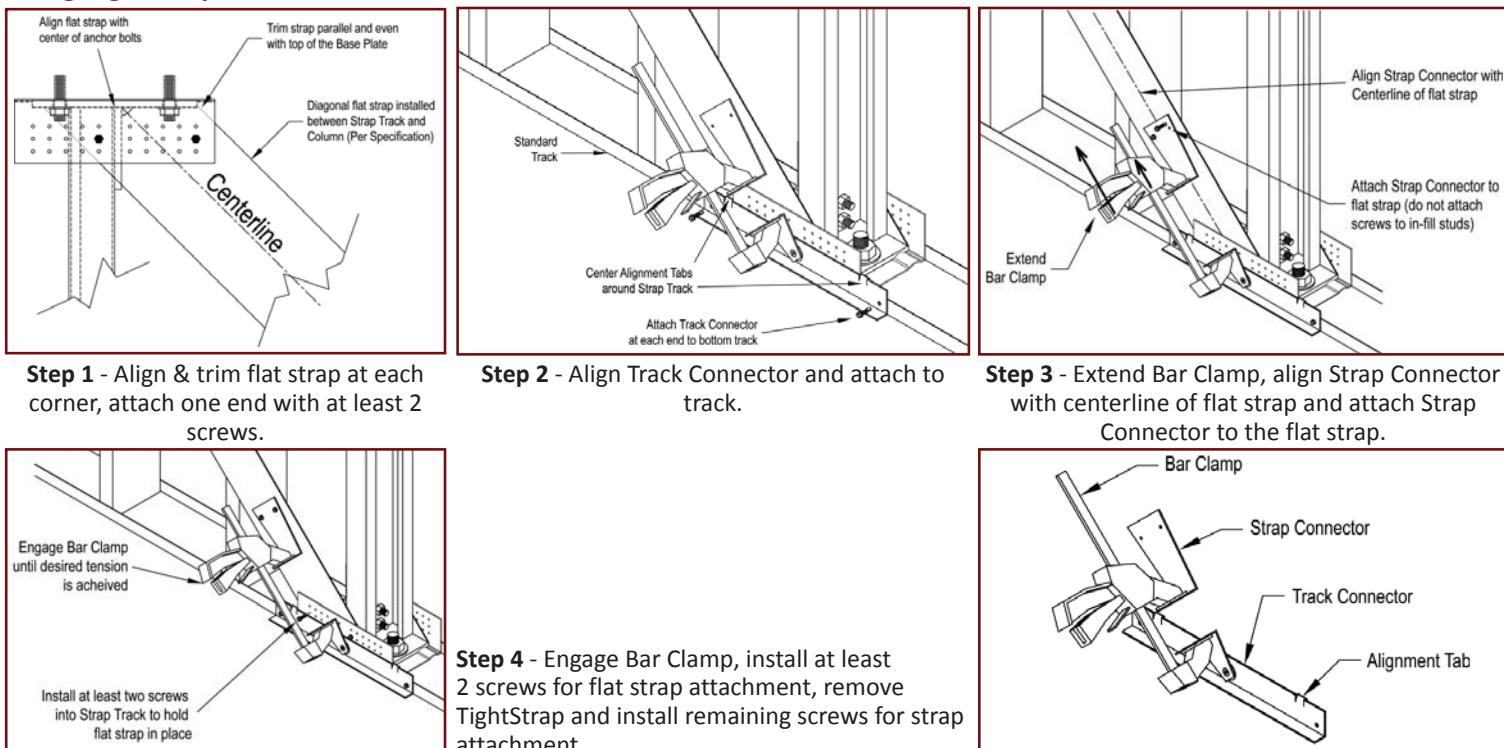

TightStrap is designed to be used in both StiffWall® and generic flat strap shear walls.

TightStrap's track connector fastens to standard track at the corners of the shear wall to provide a base for the tensioning process. It is preferable to tighten the flat straps after applying some vertical load (own weight) on top of the shear wall panel. View the animated installation procedure at www.steelnetwork.com.

Patent Pending

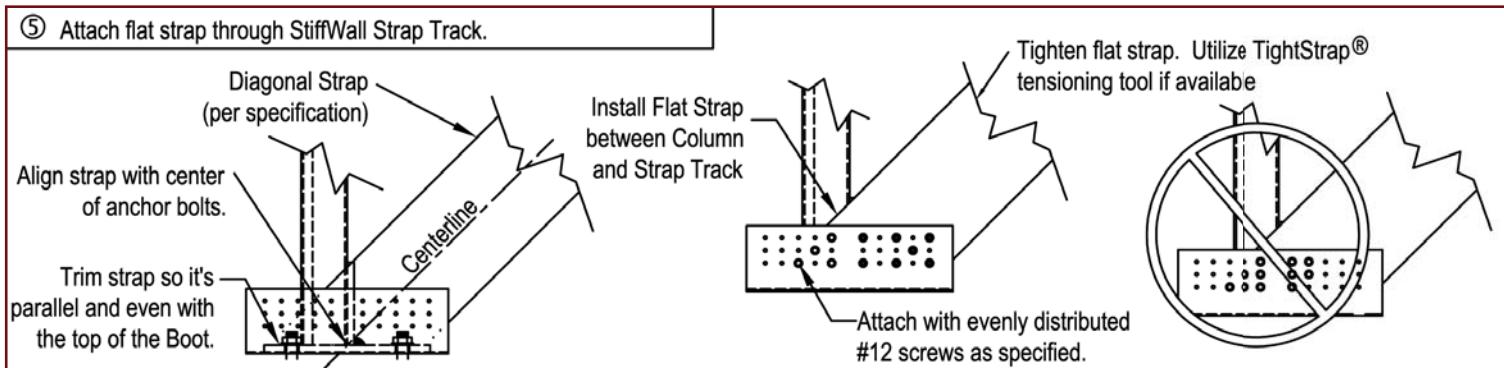

Using TightStrap®

How to Install the StiffWall® Shear Wall:

The boots are attached to the foundation or floor and the roof or ceiling with approved anchors or bolts as determined and approved by the Engineer (Boots are made up of the Strap Track and the "T" shaped Base Plate)

- Light, Small & Medium Boots utilize a 7/8" anchor bolt or threaded rod.
- Transition and Large Boots utilize a 1 1/4" anchor bolt or threaded rod.
- Attach the Flat Strap to the Strap Track, corner to corner, on both sides (4 straps needed) with the specified amount of #12 screws (or weld). The use of low profile screws help to reduce a "bump out" of finished sheetrock. To achieve the designed loads, the strap should be tight from corner to corner (with no slack). This is done by tightening the strap after the wall is loaded with a TightStrap® tool.

Load Bearing Wall Members

Welded Assembly - Single Column

Welded Corner Connections

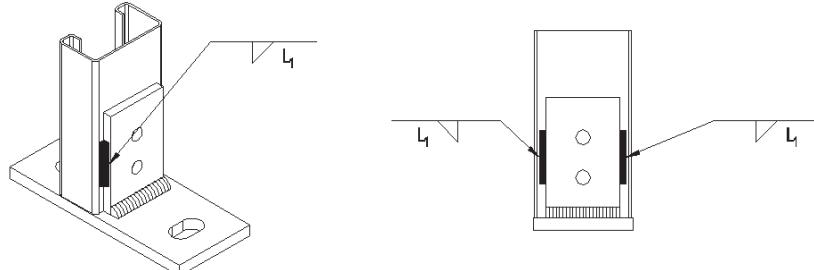

The Steel Network provides information on the welds required to obtain full capacity of the StiffWall® SWS system. The option to weld the SWS columns to the boots or to bolt the SWS columns to the boot offers the same capacity for both T1 and T2 values. Since welding is common for many applications, reference Single Column page (this page) & Double Column page for guidance on weld size, locations, and specifications to ensure that full capacity is obtained when welding the various boot sizes to the various columns sizes. CAD Details indicating the various welds are available if needed. If additional information is required please contact The Steel Network's Technical services department at (888) 474-4876.

Single Column Weld Requirements			
Column Size	Boot Type	Longitudinal Welds L_1 (each side) (in)	Transverse Weld L_2 (in)
350 / 362 / 400	Small	2.0	0.0
	Medium / Transition	5.0	0.0
	Large	7.0	0.0
550 / 600	Small	2.0	2.0
	Medium / Transition	5.0	4.0
	Large	9.0	4.0
800	Small	2.0	2.0
	Medium / Transition	5.0	5.0
	Large	9.0	5.0

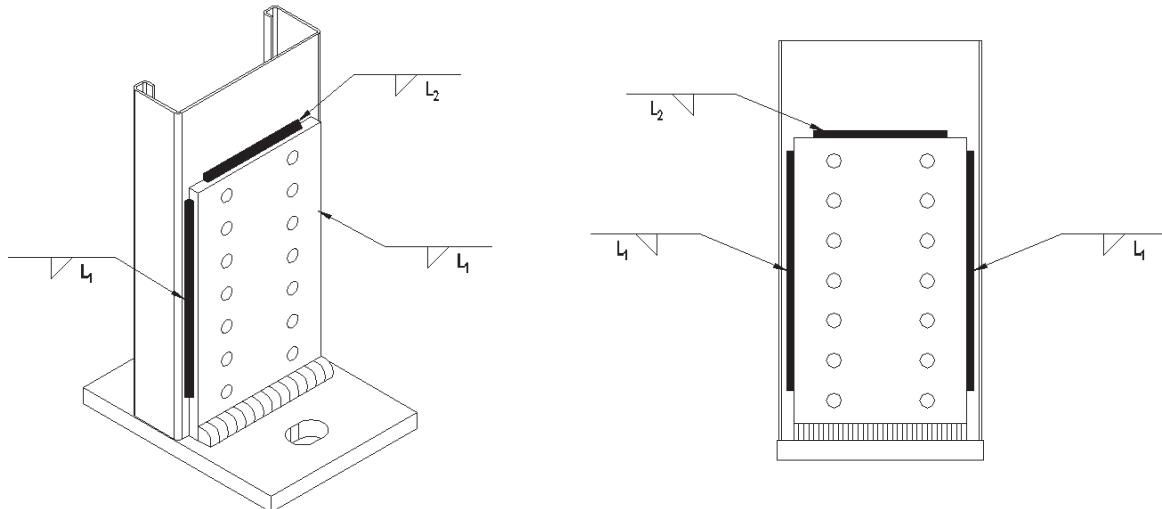

Table Notes

- Welded column-boot option applies to columns of thickness 54mil to 118mil only.
- See details for locations of weld lines L_1 and L_2 .
- Weld size is minimum two times thickness of column and maximum $\frac{1}{4}$ ".
- Fillet Weld designation is E70XX Metal Arc or Equivalent.
- All welds shall be touched-up using zinc rich paint.

Large Boot Details

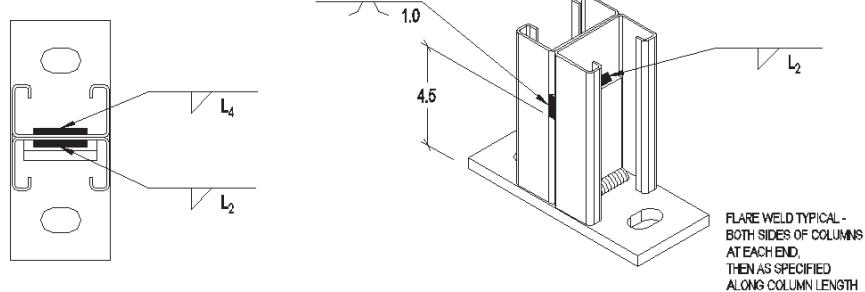

Load Bearing Wall Members

Welded Assembly - Double Column

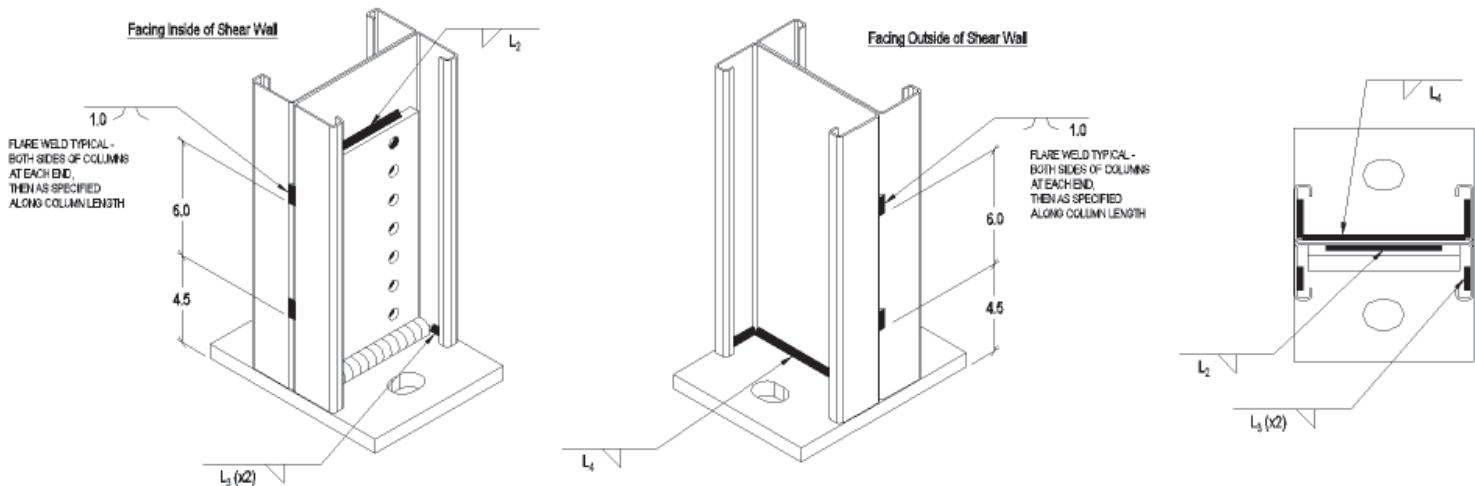

Double Column Weld Requirements					
Column Size	Boot Type	Transverse Weld			
		Top L ₂ (in)	Bottom L ₃ (each side) (in)	Bottom L ₄ (in)	# of Inside 1/2" Holes
350 / 362 / 400	Small	2.0	0.0	2.0	0
	Medium / Transition	2.5	0.0	4.0	0
	Large	2.5	0.0	4.0	5
550 / 600	Small	4.0	0.0	4.0	0
	Medium / Transition	4.5	0.0	5.5	0
	Large	4.5	1.0	6.5	8
800	Small	4.0	0.0	4.0	0
	Medium / Transition	6.5	0.0	7.0	0
	Large	6.5	1.0	7.0	8

- Welded column-boot option applies to columns of thickness 54mil to 118mil only.
- Large boot requires weld between boot and column through 9/16" holes as indicated in table.
- See details for locations of weld lines L₁ and L₂.
- Weld size is minimum two times thickness of column and maximum 1/4".
- Fillet Weld designation is E70XX Metal Arc or Equivalent.
- All welds shall be touched-up using zinc rich paint.

Load Bearing Wall Members

Other Design Considerations

StiffWall® Placement in Load Bearing Wall

StiffWall is usually not designed as a gravity load bearing element. However, its boundary end columns can see compression loads from the floor weight above. This system is designed to sit in between load bearing studs and address all of the lateral loads acting on that building due to wind or earthquakes.

The StiffWall is designed to stack vertically and attach through the floor system to the level above (Fig. 1). The Columns for one floor must line up with the columns on the floors above and below. This will allow for the bolts from one floor to be bolted through the floor system to the boots above and/or below. It is important that these bolts are properly aligned through each floor for the walls to be able to work together as one unit from top to bottom. Do not enlarge the anchor holes in the StiffWall® Boots.

It is recommended that StiffWall boundary end columns have axial compression capacity greater than or equal to the typical load bearing stud within the wall.

Attachment of Sheathing to the StiffWall® Column

Since the StiffWall assembly is installed within the thickness of the top and bottom tracks, sheathing should not be attached directly to the StiffWall Column. The thickness of the strap track on either side of the wall (97mils [12ga]) reduces the depth of the StiffWall Column within the assembly (Fig. 2). As a result, if the sheathing is attached to the StiffWall Column, a level plane will not occur along the wall. Attach the sheathing to the infill studs bordering the StiffWall columns.

Vertically Stacking Shear Walls

StiffWall shear walls transfer loads concentrically from the floor element above to the floor element below. The StiffWall system should consist of vertically stacked panels to effectively transfer lateral forces to the foundation (Fig. 3). Any eccentricity in the system negatively effects the load distribution to the StiffWall components. The vertical alignment of the walls is critical for the through-floor connections. Coordinate installation to ensure through-floor connectors align with StiffWall Boots on the floors above and below.

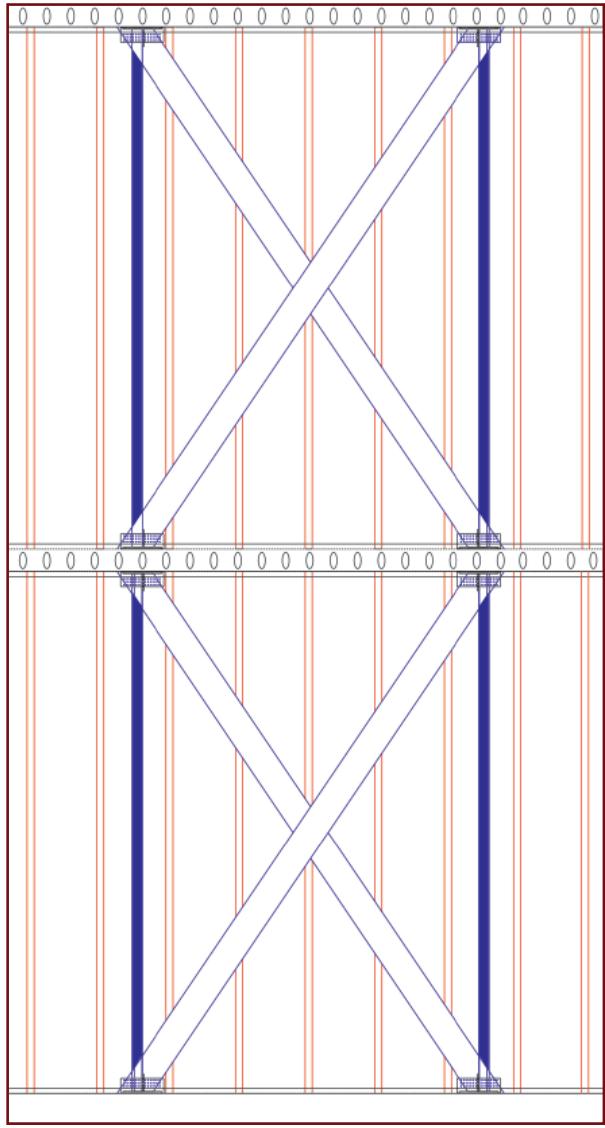

Fig. 1: StiffWall Column/Boot Assembly (blue line) is placed within the spacing of the SigmaStud® (in red).

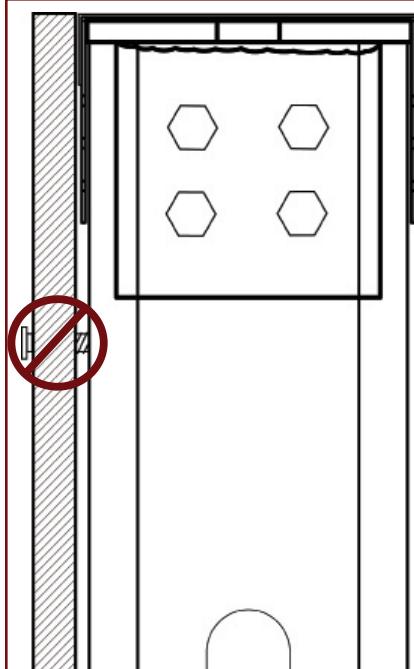

Fig. 2: Sheathing should not be attached directly to the StiffWall Column. Attach the sheathing to the adjacent studs.

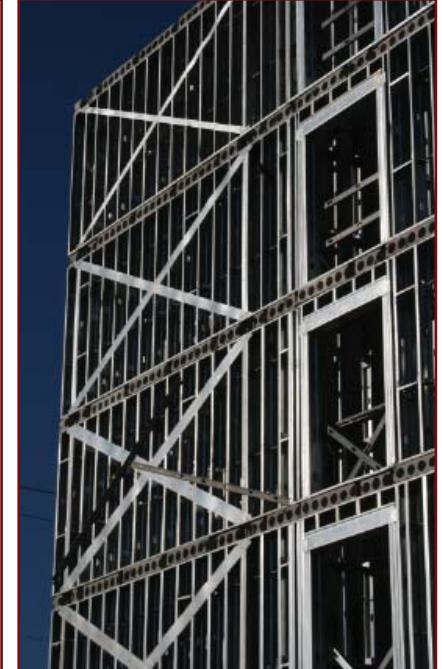

Fig. 3: Shear walls should be stacked vertically.

The industry's #1 tool for the design of Members, Connections, Fasteners & Details

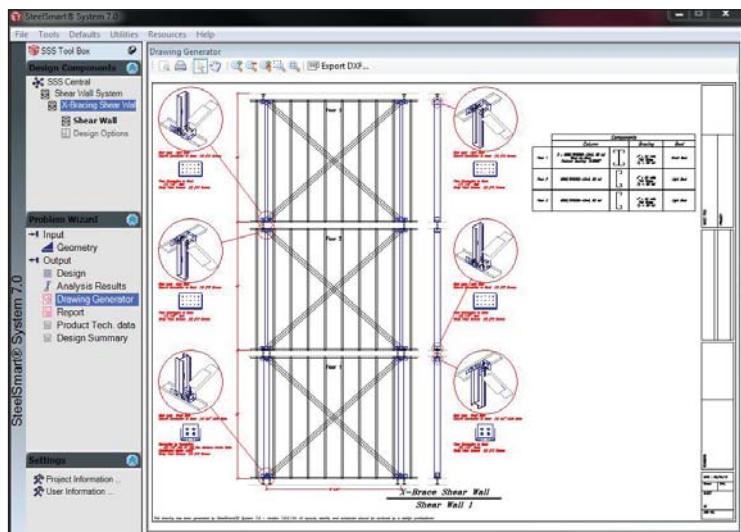

Introduction:

SteelSmart® System (SSS) provides construction professionals with an essential tool engineered for both fast and accurate design. SSS 7 raises the bar for light steel framing analysis and design by seamlessly integrating the well-known analytic power of its predecessors with additional functionality and accessibility.

Available as a complete suite, SteelSmart System 7 will streamline production through the design and detailing of members, connections, and fasteners. Available design modules include: Curtain Wall, Load Bearing Wall, X-Brace Shear Wall, Floor Framing, Roof Framing, Roof Truss, and Moment-Resisting Short Wall. SSS 7 incorporates two Advanced Features, the Load Generator and Distributor and the Layout and Connection Details Generator, that further aid the user in the design process.

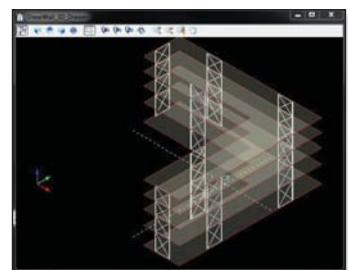

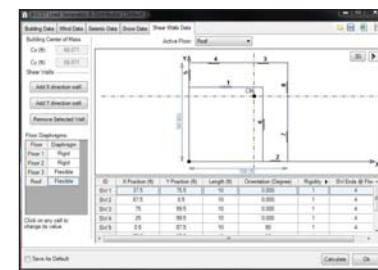

Order online at www.steelsmartsystem.com

Layout and Connection Details Generator

A major feature of SSS is the Layout and Connection Details generator. The framing layout of components is generated with connection details that include connection design data (clips designations, number of fasteners, embedment lengths, and screw patterns). The drawing generator is included within all 7 primary design modules, and will create a detail upon successful design of components. The drawings can be printed or exported in the AutoCAD® DXF format allowing the drawings to be easily transferred into other drafting software.

In addition to the Layout and Connection Details generator, there is also a library of component details within SSS. Details are split into 7 categories including: Curtain Wall, Load Bearing Walls, Shear Walls, Products Details, Floor Framing, Roof Framing, and LSF Systems.

Load Generator and Distributor

The Load Generator and Distributor tool uses the dimensions and load specification for a building to calculate the lateral wind and seismic forces according to ASCE 7 "Minimum Design Loads for Buildings and Other Structures." Now included in the Load Generator is the IBC 2012 and ASCE 7-10 design codes for development of lateral forces and snow loads. The output from the load generator gives the laterals forces distributed between floor levels and the shear walls at that floor level. The method of distribution considers either rigid or flexible floor diaphragms, while considering torsional effects when rigid diaphragms are selected. Output can be exported directly into the X-Brace Shear Wall design module or into an Excel spreadsheet.

Product Use

Products in this catalog are designed and manufactured for the specific purposes shown, and should not be used in other applications unless approved by a qualified design professional. All modifications to products or changes in installation procedures should be made by a qualified design professional. The performance of such modified products or altered installation procedures is the sole responsibility of the design professional or installation contractor. The installation contractor and/or qualified design professional are responsible for installing all products in accordance with relevant specifications and building codes.

Customers modifying products or installation procedures, or designing non-standard products for fabrication by The Steel Network, Inc. ("TSN") shall, regardless of specific instructions to the user, indemnify, defend, and hold TSN harmless for any and all claimed loss or damage occasioned in whole or in part by non-standard or modified products or installation procedures.

Loads published on TSN's website and current product catalogs are for the described specific applications of properly installed products. Modifications to TSN products, improper loading or installation procedures, or deviations from recommended applications will affect TSN products' load-carrying capacities. TSN products are fabricated from hot-dipped galvanized steel for corrosion protection but will corrode and lose load-carrying capacity if exposed to salt air, corrosive fire-retardant chemicals, fertilizers, or other substances that may adversely affect steel or its galvanized coating. The current editions of TSN's catalogs and load tables published on this website may reflect changes in the allowable loads and configurations of some of TSN's products. This information supersedes information in earlier catalogs or technical reports. All earlier catalogs or technical reports should be discarded and reference made exclusively to the versions available at <http://www.steelnetwork.com/Site/LSF>. TSN may correct any clerical or typographical errors. All sales are subject to TSN's standard terms and conditions of sale.

Limited Warranty

TSN warrants its products to be free from defects in material or workmanship at the time of shipment. TSN standard catalog products are warranted for adequacy of design when used in accordance with design limits in this document and properly specified and installed. This warranty excludes uses not in compliance with specific applications and installation procedures set forth in this document. Warranty claims must be made by Purchaser in writing within ninety (90) days of receipt of the Products.

All warranty obligations of TSN shall be limited, at the sole discretion of TSN, to repair or replace the defective product(s). These remedies shall constitute TSN's sole obligation and sole remedy of purchaser under this warranty. In no event will TSN be responsible for incidental, consequential, indirect, exemplary, special, or punitive damages, or other losses or damages however caused, including, but not limited to, installation costs, lost revenue or lost profits. TSN's liability for damages shall in no event exceed the applicable portion of the purchase price for defective product(s).

Product defects that arise from acts of God, accidents, misuse, misapplication, improper installation, storage damage, negligence, or modification to product(s) or its components are specifically excluded from this warranty. Product defects that arise from Purchaser providing incorrect information to TSN, including but not limited to incorrect specifications such as incorrect dimensions, designs and/or loads, are also specifically excluded from this warranty. TSN does not authorize any person or party to assume or create for it any other obligation or liability in connection with Products except as set forth herein.

This Warranty is expressly in lieu of all other warranties, expressed or implied, including any warranties of merchantability or fitness for a particular purpose, all such other warranties being hereby expressly excluded.

Patented Technology

VertiClip®, VertiTrack®, BridgeClip®, BridgeBar®, BuckleBridge®, StiffClip®, DriftClip®, DriftTrak®, DriftCorner®, JamStud®, StiffWall®, SigmaStud®, SigmaTrak®TightStrap®, CircleTrak®, PrimeWall® and BackIt® are trademarked products, and are patented or patent-pending technologies of TSN. Patent numbers are: #5,904,023; #5,467,566; #5,906,080; #6,701,689; and #6,892,504. Numerous TSN design configurations are patented and/or patent pending and are protected under US and International patent laws.
